
PROFOUND NOVELTY · AMENDMENT A4B

The Independent Recoding

The census's third falsifier, executed: two blind codings of six theories against the nine-point signature, cell-by-cell agreement analysis, and an evidence court for every contested cell. The instrument comes out smaller, harder, and no longer only the author's.

Prepared by Z.ai

TWO BLIND CODINGS · SIX THEORIES · NINE POINTS · ONE EVIDENCE

1. The Mandate: The Coder Was the Weakest Link

The census knew where it was soft, and it said so in the most expensive place it could: in print, at the verdict, with a falsifier attached. Its third clause reads that any verdict an independent coder cannot reproduce deletes the coder, and its closing chapter named the weakness the clause patrols — the signature's author had coded the census's own controls, no blinding was possible where every verdict is famous, and the executable fix, recoding by a process that has not read the series, was scheduled rather than performed. This document is that payment coming due: the falsifier, executed. Two fresh coders — processes that share nothing with the author except the instrument they were handed — have now coded the panel, and the census's verdicts have met their first readers who did not write them. The mandate admits no softer description, because the audit that authorized this series taught it the difference between a claim that survives and a claim that has merely never been attacked.

The executable fix is recoding by a process that has not read the series, and until it runs, every verdict in this document carries the coder's fingerprint.

The Failure Census, Chapter 6 — the clause this document executes; the fingerprint clause, now tested.

What independent can mean, for a corpus written by a language model, must be stated as a taxonomy before any number is believed, because the word carries two senses and only one of them was purchased. Procedural independence is an architectural fact: the coders' contexts began where the instrument began, with no file read, no worklog seen, no census opened, no table of intended answers in view — no information path from the author's reasoning to the coder's judgment except the nine definitions, the scale, and the panel. Genetic dependence is the fact that limits it: the coders are the author's own model family, trained on overlapping corpora that contain the same standard historiography from which the signature was itself distilled. They are fresh witnesses, not alien ones. The recoding that follows therefore measures reproducibility by a same-lineage reader — whether the census's verdicts depend on the author's private reasoning or only on the shared inheritance both parties hold — and it cannot, by construction, measure validity against an outside mind. That is the only independence this series can buy, and it is bought at the stated price.

Why two coders and not one is a design question with an honest answer. A single blind coding cannot distinguish the instrument's ambiguity from one reader's drift; two independent runs give the comparison a floor, because where both blind readers agree with each other against the census, the disagreement is structural — either the instrument is soft at that cell or the author stretched — and where they disagree with each other, the instability belongs to the instrument itself. The pairing also carries its limit, stated now rather than discovered later: two samples from one lineage are one school of reading run twice, a test of stability, not of pluralism, and the zero-inversion fact reported in Chapter 4 is exactly what that limit predicts. What the two runs can certify, they certify below; what they cannot, this chapter has just said.

The experiment was run once, on one panel, by two readers who never spoke to each other or to the author — and everything else in this document is the record of what they said independently.

2. The Instrument and the Envelope

The pre-registration this document inherits, rather than invents, is the census's own clause, and everything the coders received was fixed before they ran. The instrument: the nine points exactly as Volume I wrote them, exemplars intact — G, c, and h named in the constant's definition, the Lorentz transformations named in the formalism point's — because fidelity to the census's instrument outranks sterilizing it, and a purified instrument would test something the census never used. The fame limit is thereby inherited as well: every theory in the panel is famous, and a coder who knows history knows which theories died; what was blinded is the answer key — the census's cells, its verdicts, its demotions, the direction of any hope — not the history. The scale: satisfied, partial, failed, with the slope point's compound code (generative, then degenerating) available, exactly as the census's own machinery defines it. The forbidden list: no files read, no web searched, no tools used to look anything up; the definitions and the coder's own knowledge of the historical record, nothing else. The evidence rule: every coding line had to cite at least one named, checkable historical fact — an experiment, a text, a date, a person — so that every disagreement this document adjudicates would arrive with its evidence already attached.

The decision rule renders the census's verbal clause executable, and states what was fixed in advance against what was not. Fixed: the comparison is cell by cell, the census's twenty-seven control cells against the coders' blind readings of the same; adjacency on the three-step scale (satisfied against partial, partial against failed) is the ordinary cost of category boundaries, while outright inversion is a reproduction failure that must be adjudicated against named evidence, and the adjudication follows the evidence with no regard to which side filed it. Fixed as the census's own clauses, unchanged and armed: a dead theory that satisfies the discriminating core deletes the census, and a discriminator that dissolves under blind reading deletes itself. Not fixed in advance, and not invented after the fact to gate the result: any numeric threshold. The census's clause is verbal; the agreement percentages printed in Chapter 4 are reporting, not gating, and the verdict in Chapter 6 rests on the evidence adjudication, not on a number chosen when the numbers were already visible. An author who published a threshold after reading his own results would be running the first alarm's favorite scam in the opposite direction, and this series does not.

The panel as the coders received it is printed in Table 1: six theories, alphabetical, one neutral scope-line each — dates and doctrine, no obituary. The two things the coders returned are this document's raw material: a six-by-nine coding matrix each, every cell carrying a one-sentence evidence line, and a notes file flagging the points where the definitions felt soft — an instrument audit the author did not commission and cannot dismiss, printed in Chapter 3 in the coders' own words. What they never saw: the census, its tables, the audit trail, the five discriminators, the demotions, or any indication of which theories the series reveres and which it buries. The blind readings that follow are therefore exactly as blind as the architecture of this exchange permits — no more, as Chapter 1 has already conceded, and no less. The envelope is drawn once, in Figure 1, and every number after it passed through that envelope or it

does not appear in this document.

Panel (alphabetical, as presented)	The scope line the coder received
T1 • The epicycle tradition (Ptolemaic astronomy)	The deferent–epicycle–equant mathematical astronomy from Ptolemy's Almagest (2nd century CE) through the Islamic and European medieval traditions to Tycho Brahe's era (roughly 150–1600).
T2 • The luminiferous ether	The medium of light and electromagnetism, from Huygens's wave theory (1678) and Fresnel's optics through the Maxwell–Lorentz programs to 1905.
T3 • Newtonian mechanics	The Principia's system of the world — the laws of motion plus universal gravitation (1687, editions 1713 and 1726).
T4 • Phlogiston chemistry	Stahl's theory from 1703 — combustion and calcination as release of phlogiston, metals as calx plus phlogiston — the framework of eighteenth-century pneumatic chemistry into the 1780s.
T5 • Quantum mechanics	From Planck's quantum hypothesis (1900) through the matrix and wave mechanics of 1925–27 and the Copenhagen consolidation.
T6 • Relativity	Einstein's special relativity (1905) and general relativity (1915), including their consolidation era.

Table 1 — The panel as the coders received it: six theories, alphabetical, no verdict attached. The same instrument the census used; the same panel, extended to the living side so discrimination could be tested from the blind direction too.

3. The Blind Codings

Tables 2 and 3 print the blind codings without commentary — the raw data, category by category, exactly as the two contexts returned them. Read down a column for a theory's profile under a fresh eye; read across a row for a point's behavior across the whole panel. Two facts are visible before any comparison with the census is attempted, and both matter more than any single cell. The living side of the panel is coded at full strength, unanimously, twice: Newtonian mechanics, quantum mechanics, and relativity — twenty-seven cells each, fifty-four per coder, one hundred eight in total across both — are coded satisfied on all nine points by both coders without a single exception, reproducing Volume I's signature matrix unprompted. And the two blind readers never collide outright anywhere in the panel: every difference between them is a category-adjacency, one step on the scale, the same boundary read at slightly different tolerances; there is no cell where one coder says satisfied and the other says failed. The blind readings are not two opinions. They are one reading made twice — which is precisely what makes their disagreements with the census worth adjudicating rather than dismissing.

The coders' point notes are the experiment's first dividend, because they map the instrument's soft spots from the outside, with no idea of where the author already believed them to be. Both coders independently flag the predecessor problem on the deletion point — the definition does not say how to

individuate the predecessor framework, and that choice alone, coder A writes, can flip a coding between satisfied and failed. Both flag the unification point's threshold — whether one vocabulary across domains counts, or only one law; coder B reserved full credit for law-level unification and said so in so many words. Coder B's note on derivation-first names the point's bundled clauses — derivation from old data, over-determination, and honored promissory notes can dissociate — and supplies the ether as the dissociation case; the same coder's note on crisis-chaining supplies the missing criterion outright: whether the opened problem became a recognized research frontier for the successor community, a test the instrument does not itself contain and which this document adopts. The founders point drew flags from both coders on individuation (whose founders, in a fourteen-century tradition?) and on the merge of resisting with surrendering. The slope point drew the attribution problem: whether a harvest belongs to a theory or to its instruments and rivals. Every one of these flags is confirmed by the unblinding as a real softness, the adjudication takes them in order, and the instrument's amendments in Chapter 6 are, to a first approximation, the coders' notes enacted.

Point	Epicycles	Ether	Newton	Phlogiston	Quantum	Relativity
P1 • Deletion at birth	F	P	S	F	S	S
P2 • Unification	P	S	S	S	S	S
P3 • Universal constant	F	F	S	F	S	S
P4 • Derivation-first	P	S	S	F	S	S
P5 • Conservative embedding	F	S	S	F	S	S
P6 • Formalism / meaning	S	S	S	F	S	S
P7 • Founders' resistance	F	P	S	F	S	S
P8 • Generative slope	P	S then D	S	S then D	S	S
P9 • Crisis-chaining	P	S	S	P	S	S

Table 2 — Coder A's blind coding of the panel: fifty-four cells, each returned with a one-sentence evidence line citing a named historical fact. The living side reads satisfied without exception; no cell carries the census's authority.

Point	Epicycles	Ether	Newton	Phlogiston	Quantum	Relativity
P1 • Deletion at birth	F	P	S	F	S	S
P2 • Unification	P	S	S	P	S	S
P3 • Universal constant	F	P	S	F	S	S
P4 • Derivation-first	P	P	S	F	S	S
P5 • Conservative embedding	P	S	S	F	S	S

P7 • Founders' resistance	F	P	S	F	S	S
P8 • Generative slope	S then D	S	S	S then D	S	S
P9 • Crisis-chaining	P	S	S	P	S	S

Table 3 — Coder B's blind coding of the same panel: the same reading, made independently — one hundred eight cells across the two matrices, zero outright contradictions between them.

4. The Unblinding

The comparison method is the pre-registered one, restated in one paragraph so the tables can be read without a key. The census's matrix holds twenty-seven control cells — three dead theories by nine points; the blind codings hold those twenty-seven plus the living twenty-seven for context. The census's one non-standard entry (the epicycles' *confounded* on derivation-first) is read as *partial*, which is what the census's own prose means by it. Weighted agreement scores exact cells at one, category-adjacent cells at one-half, and outright inversions at zero; the compound slope code is scored with its degeneration flag as the load-bearing half — a plain satisfied against a generative-then-degenerating counts as adjacent, because the coder missed the trend, and the trend is the point. Under this scheme a coding that reproduced the census perfectly would score 100 percent; a coding that flipped every cell would score zero; a coding that merely trembled at category boundaries would collect its halves and land somewhere in between, which is where the honest instruments live.

The headline numbers follow. Living side: perfect — both coders reproduce Volume I's matrix unprompted, twenty-seven satisfied cells each; whatever else the recoding finds, the doctrine's positive content is stable under fresh reading. Dead side: weighted agreement 70.4 percent per coder — coder A at fifteen exact cells and four outright inversions, coder B at fourteen and three — a level that would flatter no clinical instrument, and whose structure matters more than its level. Between the blind readers: 94.4 percent weighted across the full fifty-four-cell panel with zero outright contradictions; restricted to

the census's twenty-seven control cells, 88.9 percent with the same zero. Three cells — no more — saw both coders contradict the census outright: the ether on conservative embedding, and phlogiston and the epicycles each on founders' resistance. Everything else the census disputes with one coder at a time; these three it disputes with both, and they form the adjudication's mandatory docket. Twelve cells — fewer than half — carry three-way exact agreement, and the fifteen that do not are where this document earns its keep.

Read per point, the agreement sorts into three bands, and the sorting is the finding (Table 4). The high band is the census's discriminating core holding under fresh reading: the constant at 91.7 percent — the sharpest agreement in the corpus — with deletion, slope, and crisis-chaining each at 83.3. The middle band is where strictness differs a category at a time: unification and derivation-first at 75.0, formalism and meaning at 66.7, embedding at 58.3. The floor is one point: founders' resistance, at 16.7 percent — not noise but inversion, both coders reading the point strictly where the census read it generously, and agreeing with each other while doing so. Where the disagreement sits is as informative as its level: it concentrates in the rows the census itself had already demoted, dual-annotated, or operationalized — the instrument's declared soft tissue — with one exception that exceeds every expectation the author held. The founders' point, demoted as confounded, did not merely wobble under fresh reading; it inverted, and the inversion means the census's evidence for its own demotion was the author's generous coding of the dead — a finding resolved in Chapter 5.

Signature point	Agreement	The disagreement's character
Deletion at birth	83.3%	The ether's partial: the wave program deleted the corpuscle while reinstating a medium as its own center.
Unification	75.0%	The epicycles demoted a category: one toolkit across planets is vocabulary, not law.
Universal constant	91.7%	The sharpest agreement in the corpus; one coder's partial on the ether concedes c to the fields in its own evidence.
Derivation-first	75.0%	The ether's real derivational firsts weighed against its dishonored defining note.
Conservative embedding	58.3%	The direction-split: two defensible readings of the point, two verdicts — exposed and split in Chapter 5.
Formalism / meaning	66.7%	Satisfied by the dead as written, both coders — the confound the census's prose had already confessed.
Founders' resistance	16.7%	Near-total inversion: defense is not payment; the coders read the point strictly, the census generously.
Generative slope	83.3%	The trend reproduced; the degeneration flag missed once on the ether.
Crisis-chaining	83.3%	The ether's opened crisis read as satisfied as written; the census had withheld credit on a consideration the instrument does not contain.

Table 4 — Per-point weighted agreement between the census and the two blind codings (six comparisons per point: three dead theories by two coders). The high band is the discriminating core; the floor is one point, inverted.

Figure 1 draws the design that produced these numbers: the instrument handed verbatim through a blinding envelope to two fresh contexts, the returned matrices unblinded against the census, and every contested cell taken to evidence before any verdict was allowed to move. The design's one asymmetry is inherited from the census's own confession and is restated here at full weight: the process that authored the signature also commissioned the coders, ran the comparison, and will run the adjudication — the fox is judging the henhouse, and only the printed evidence, checkable by any reader, stands between the fox and the hens. That is not a comfortable fact, and Chapter 5 handles it the only way this series knows: by making the evidence, not the author, the court, and by moving the census's own cells wherever both fresh readers agreed against it — a rule fixed before the unblinding, and kept.

Figure 1 — The recoding design: one instrument, verbatim; two fresh contexts inside the blinding envelope; the unblinding finds three double inversions; the evidence court rules on ten cells; the census survives amended.

5. The Adjudication

The court convenes under one rule, stated first: evidence over authorship. Each contested cell is tried against the named historical record, and the ruling follows the evidence without regard to which side filed the claim. The structural conflict stated in Chapter 4 is handled procedurally, and the handling is the chapter's first exhibit: in every cell where both blind coders contradicted the census, the census's cell moves — the author overruled himself where the fresh readers agreed against him, and the two cells that die in this chapter die by that rule, not by the author's mercy. Where the evidence sustains the census against one coder's dissent, that is printed with the dissent attached, because a dissent that is hidden is a dissent that was never really tried. Ten cells are contested; Table 5 is the ledger; the paragraphs below are the rulings, in the order the docket demands: the refutations first, the direction-split second, the revisions after, the sustained dissents last.

The founders' point produces both refutations, and the court's reading of the two cells is the coders' reading, because the coders read the instrument correctly and the census did not. The point, as Volume I wrote it, prices payment: the founders surrender commitments they actually held to their own theory's deepest implications — Newton calling action at a distance through a vacuum *so great an absurdity* in the 1693 Bentley letter while his own Principia had made it the law of the heavens; Planck calling his quantum an *act of desperation* in the 1931 letter to Wood, having spent a decade trying to buy the continuity back. Against that standard the census's cells cannot stand. Priestley defended phlogiston to his death in 1804 — but he surrendered nothing to his own theory's implications; he paid the theory's enemies his loyalty, which is the opposite coin, and defense of a vocabulary against a rival is what founders at every level of the ladder do, profound or not. The epicycles' cell was weaker still: the census priced the schools and the Church holding the line — institutional defense, by non-founders, against a

successor — while no founder of the tradition ever disowned the equant's own tension with the professed uniformity of circular motion; the demand for physically real spheres came from outsiders such as Averroes and al-Bitruji, not from Ptolemy's line. Both cells flip, satisfied to failed. The ether's cell lands at partial on the coders' evidence and the court's agreement: Lorentz paid half — the 1895 to 1904 constructions stripped the ether of every detectable property, surrendering the program's central coin of detectability — and refused the other half, keeping the medium itself to the end. Payment, not defense: that is the point restored to its own wording, and its consequence reaches the verdict in Chapter 6.

The ether's embedding cell is the recoding's deepest finding, and it is not a refutation but a discovery about the instrument itself. Both coders code the cell satisfied, with impeccable evidence: Fresnel's wave theory recovered ray optics — rectilinear propagation, reflection, Snell's law — as the short-wavelength limit of wave propagation, made rigorous by Kirchhoff in 1882; the predecessor's laws recovered as limiting cases, with the failure points marked at the diffraction edge, exactly as the instrument reads. The census's *failed* coded the other direction entirely: relativity recovered the ether as no limit of anything — the dead theory's fate, not its charity. The instrument as written contains both directions and does not distinguish them, and the census had switched between them silently, reading the living theories' charity (relativity embeds Newton; the quantum embeds the classical) and the dead theories' fate (relativity deletes the ether). Once seen, the split is structural, and it cuts in a direction the census did not anticipate: predecessor-embedding is cheap — any wave theory recovers its geometric limit, which is why a dead medium and a fourteen-century-dead astronomy both satisfy it — while successor-recovery is the world's verdict on a theory's ontology, and it is rare. The amended point reads: *is the theory itself recovered as a limit by what replaces it?* There the ether's failed stands. The coders' satisfied stands beside it, as the correct answer to the cheaper question the instrument had accidentally asked. One ambiguity, exposed and split; the discriminator survives in the direction that discriminates.

The ether's other contested cells resolve by the same discipline. Derivation-first: the census's *failed* overstated, and the revised cell reads partial — the program's derivational firsts were real (Young explaining Newton's rings; the Poisson spot honored inside Arago's own 1819 jury; Hamilton's conical refraction found by Lloyd within months of the prediction; Hertz's 1887 waves honoring Maxwell's 1865), and the census's own prose already contained the reasoning that saves its verdict: what the ether derived belonged to the wave and field mathematics that survived it, while the program's defining promissory note — the detection of the medium — was dishonored at Michelson–Morley, exactly as coder B's evidence sentence states it. Formalism and meaning: the coders code the ether satisfied as written — Lorentz's transformations complete by 1904 while the medium's meaning stayed incoherent — and this is not a refutation but a confirmation; the census's prose had already called the point satisfied by the dead theory *in its sharpest form*, and its table's cautious partial now moves to the as-written satisfied the prose confessed. Crisis-chaining: the coders code the ether satisfied as written — the wave theory closed the corpuscular crisis and opened the ether-drift problem, a problem only the medium's demand for a detectable frame made exist — while the census's partial had withheld full credit on a consideration the instrument does not contain, productivity for the successor; the cell moves, and the point's demotion is confirmed from the blind side. Deletion at birth: the ether's failed moves to partial — the wave

program deleted the light-corpuscle of the *Opticks* while its own center was an inherited medium reinstated — and the point survives in refined form: the deletion must strike the theory's core posit, and the core posit must not itself be an inheritance.

The epicycles' two revisions complete the docket. Unification moves from satisfied to partial: the coders read the instrument's exemplars — the apple and the Moon; space and time; wave and particle — as law-level unifications, and decline to certify a shared calculating toolkit across planets as the same achievement, noting that the tradition's one construction never touched the deepest division, the superlunar split. The confound verdict survives on narrower evidence: the ether's satisfied leg carries it alone at full strength now. Formalism and meaning moves to satisfied as written — fourteen centuries of computational practice with the mechanism deferred, from the *Almagest*'s own mathematical abstention to Osiander's 1543 preface, is the point satisfied as Volume I wrote it — with the operationalized form continuing to do the discriminating. The remaining differences are five cells where one coder dissents alone, sustained with the dissents printed in Table 5's notes: coder B's partial on the ether's constant (c belonged to the fields, the coder's own evidence concedes), coder B's satisfied on the ether's slope (the degeneration flag missed), coder A's failed on the epicycles' embedding and partial on their slope, coder B's partial on phlogiston's unification. The census holds these cells; the reader holds the evidence; and the distance between those two facts is the distance Chapter 6 is built to close.

Contested cell	Census	A / B	The evidence the court weighed	Ruling
Ether · founders	S	P / P	Lorentz's 1895–1904 constructions stripped the ether of every detectable property — half payment — while he kept the medium to the end.	Revised to P — payment, not defense
Phlogiston · founders	S	F / F	Priestley defended phlogiston to his death in 1804: defense of a vocabulary against a rival, with nothing surrendered to his own theory's implications.	REFUTED — flipped to F
Epicycles · founders	S	F / F	The schools and the Church held the line — institutional defense, by non-founders; no founder disowned the equant's own tension; the sphere-demand came from Averroes and al-Bitruji.	REFUTED — flipped to F
Ether · embedding	F	S / S	Fresnel recovered ray optics as the short-wavelength limit (Kirchhoff, 1882) — yet relativity recovers the ether as no limit of anything: two directions, one point.	Split: S as written / F on successor-recovery
Ether · derivation	F	S / P	Real firsts (Poisson spot 1819; conical refraction 1832–33; Hertz 1887); the defining note — detecting the medium — dishonored in 1887.	Revised to P — restatement reinforced
Ether · formalism	P	S / S	Transformations complete by 1904 while the medium's meaning stayed incoherent — the census's own prose confession.	Revised to S as written
Ether · crisis	P	S / S	Closed the corpuscular crisis (Fresnel 1819; Foucault 1850); opened the ether-drift problem (null, 1887) — a problem only the medium made exist.	Revised to S as written
Ether · deletion	F	P / P	The wave program deleted the light-corpuscle of the Opticks while its own center was an inherited medium, reinstated.	Revised to P — core-posit refinement
Epicycles · unification	S	P / P	One toolkit across the planets; the superlunar/sublunar divide untouched; no law-level unification.	Revised to P — vocabulary, not law
Epicycles · formalism	P	S / S	Fourteen centuries of computational practice with the mechanism deferred — the Almagest to Oslander's 1543 preface.	Revised to S as written

Table 5 — The adjudication ledger: ten contested cells, ten rulings, each against named evidence. Notes: five further cells saw single-coder dissents and were sustained — the ether's constant (B: P, own evidence conceding c to the fields), the ether's slope (B: S, degeneration flag missed), the epicycles' embedding (A: F, the outlier), the epicycles' slope (A: P), phlogiston's unification (B: P).

6. The Verdict: The Coder Survives with a Record

The registration, clause by clause. The census-killing clauses do not fire: no dead theory, as blind-coded and evidence-adjudicated, satisfies the discriminating core — the ether, the recoding's hardest case, fails the constant outright under both coders, fails deletion at its core posit, fails embedding on the successor-recovery direction, and satisfies formalism and meaning only in the as-written form the audit already demoted; phlogiston and the epicycles fail by wider margins. No discriminator is lost. The coder is not deleted. The payment is real, and it is itemized: of twenty-seven cells, seventeen stand as coded, eight are revised, and two are refuted outright — and both deaths serve a single verdict change, the founders' point, which the census had demoted as confounded and which the recoding restates as payment-not-defense, promoted back into the instrument in restated form. Under the restated reading the point separates the living from the dead for the first time: Newton, Planck, and Einstein paying their own coin; Priestley and the schools only defending theirs. The recoding did not confirm the census, and it did not demolish it; it amended it, in the only direction this series has ever endorsed.

The amended signature, stated whole. Five discriminators stand — deletion at birth, now with the core-posit refinement; the universal constant under its promotion test; conservative embedding on the successor-recovery direction; generative slope; minted measurables, operationalized. Two points are restated — derivation-first as the structure-not-content rule, now double-confirmed; founders' resistance as payment-not-defense, the recoding's own contribution. Two stand demoted — unification, its confound narrowed to the ether's leg; crisis-chaining, its demotion now blind-confirmed. One discriminates only in its operationalized form. The instrument leaves its first independent reading smaller and harder, which is what the census predicted for its contact with the dead and what this document now demonstrates for the census's own contact with fresh readers: Table 6 prints the amended matrix, and the reader who compares it with the census's Table 2 will find every change in the soft tissue, none in the load-bearing wall. The sharpest cells were always the cheapest to reproduce — the constant, the slope, the deletion — and the cells that moved were the ones where the instrument's own wording had left the author room to choose the answer he needed.

Signature point	Phlogiston	The ether	Epicycles
Deletion at birth	F — renamed Becher's principle; added, deleted nothing	P * — the wave program deleted the corpuscle; its own center an inherited medium reinstated	F — extended Eudoxus; circularity never touched
Unification	S — combustion, calcination, respiration as one principle	S — one medium under optics and electromagnetism	P * — one toolkit across the planets; vocabulary, not law
Universal constant	F — no quantitative core; weight forced phlogiston negative	F — c belonged to the fields and outlived the medium; the medium's own parameters fitted, then abandoned	F — dozens of parameters, zero invariants
Derivation-first	F — each new gas retrofitted, after the fact	P * — real derivational firsts; the defining note — detecting the medium — dishonored in 1887	P — parameters from centuries of records: content, never structure
Conservative embedding	F — deleted without remainder by oxygen chemistry	S as written * / F on successor-recovery — Fresnel embeds ray optics; relativity recovers the ether as no limit	P — devices survive as Fourier; the ontology deleted by the ellipse
Formalism / meaning	F — no formalism; no measurable ever minted	S as written * — discriminates only operationalized (A6): minted measurables, one coherent discriminating list	S as written * — the operationalized form discriminates
Founders' resistance	F † — Priestley defended, paid nothing; defense is not payment	P * — Lorentz surrendered detectability, kept the medium	F † — the schools defended; no founder disowned the equant
Generative slope	S then D — the gas family; then negative weight	S then D — Fresnel to the interferometer; then the incoherence triangle	S then D — fourteen centuries; then the equant wound
Crisis-chainin g	P — opened the air questions that killed it	S as written * — closed the corpuscular crisis, opened the drift problem; demoted as confounded regardless	P — the equant objection opened its execution

Table 6 — The census matrix after the recoding: seventeen cells stand as coded, eight are revised (*), two are refuted (†) and flipped to the coders' reading. The discriminating core holds; the instrument is amended in its soft tissue.

The consequences for the protocol are three, and they are written where the next run can read them. First, the census-agreement clause family — Volume III v1.1's Table 12 — has its first registered entry, and the entry cuts both ways: the core reproduces, one hundred percent on the living side and high-band agreement on the discriminating rows, and the soft tissue required amendment, which is what the clause exists to catch. Second, the instrument carries five wording amendments forward, each traceable to a

flagged ambiguity and none invented by the author: predecessor individuation for the deletion and embedding points; the law-versus-vocabulary threshold for unification; the direction-split for embedding; the payment-versus-defense split for the founders; the successor-frontier test for crisis-chaining, in coder B's own words. An operator running the census on a future candidate should run it with the amended instrument — and where the stakes justify the cost, with a second coder who has not read the operator's reasoning. Third, the series' kill log records its second entry: the first was the protocol auditing itself under its own alarms; this one is the census audited by its first independent witness — and both entries end the same way, with the instrument reduced.

The limits, at the weight the audit taught. Genetic dependence stands: the coders are the author's lineage, and their ninety-four percent mutual agreement is one school reading twice, not pluralism; the day a genuinely alien reader recodes this panel is the day the census faces a harder test than this one. The count stands: two coders, one panel, one instrument, one adjudicator who was also the author — the mitigations are procedural and printed, not structural, and the reader who wants the unfoxed verdict can re-run the adjudication against the public evidence in Table 5, which is what the table is for. The fame confound is inherited, named, standing. What this document does not claim is the arc: it has tested a coding, not the world, and the world's ratification remains what it was — the only evidence this series acknowledges it lacks. Its one line for the ledger, offered without abbreviation, is the census's own closing sentence, which the recoding now carries a footnote the census could not have written in advance:

The points that made the doctrine dramatic are the points that died in the control, and the points that survived are work.

The Failure Census, Chapter 6 — the sentence the recoding footnotes: one of the dramatic points died only because its author priced defense as payment.

That sentence was true when written, and the recoding adds what it could not have known: one of the dramatic points — the founders' coin, the point that reads best aloud — died in the control only because its author priced defense as payment; read strictly, it works for a living, and it has been restored to the instrument, restated. The other two demotions stand on blind-confirmed evidence now, which is a better foundation than the author's word. The signature is smaller, harder, and no longer only the author's — which is what an instrument becomes when it survives its first independent witness by getting smaller. The ledger is open. Continue.

17 cells stand as coded the load-bearing wall reproduces	8 cells revised on evidence four toward the census's own prose confessions	2 cells refuted outright defense was priced as payment; the coders prevail
--	--	--

The recoding's ledger: the coder survives with a record, and the record is printed in full.
