
PROFOUND NOVELTY · AMENDMENT A4C

The Widened Census

The extension rule executed: miasma against germ theory, the fourth matched pair. The alien reader ordered, the infrastructure's refusal printed as a finding, a third blind coding under a locked pre-registration — and a replication kit that makes the alien reading executable by any true outsider.

5. The Adjudication	9
6. The Verdict: Four Plus One, and the Standing Offer	13

1. The Mandate: The Alien Reader Was Ordered; the Market Had None

The recoding's closing limit was written as a debt, and this document is the payment attempt. Amendment A4b ended by conceding that its two blind coders, whatever their procedural independence, were the author's own model family — fresh witnesses, not alien ones — and it armed the concession as a date: the day a genuinely alien reader recodes the panel is the day the census faces a test harder than any it has passed. The order that produced this amendment was therefore twofold, and both halves were the series' own clauses coming due. First, re-run the census with a genuinely alien reader — a coder from a different model family — so that everything in the coding that is lineage would finally vary: the shared training, the shared historiography, the shared dispositions about how a famous theory should be read. Second, widen the panel by the census's own extension rule, which had queued its next matched pair in print: miasma theory against germ theory, ready the moment germ theory entered the case base.

The day a genuinely alien reader recodes this panel is the day the census faces a harder test than this one.

The Independent Recoding, Chapter 6 — the clause this document was ordered to execute; the market, as Chapter 2 reports, had no alien in stock.

What happened to the first half must be stated before anything else this document claims, because it is the difference between an amendment and an advertisement. A reader from a different family was requested — twice, under two different family names — and the delivery infrastructure returned the same family both times. The runtime's own records, which Chapter 2 prints, show every request for an external reader resolved to the same model identifier that this environment supplies for any subagent it spawns: the author's lineage, and nothing else. A control probe with a trivial prompt confirmed the mapping was not a one-time failure. A genuinely alien reader cannot be purchased here, and this amendment does not claim one was. The census treats the refusal as data rather than as embarrassment: the clause designed to break genetic dependence is limited not by the protocol's design but by the market's supply, and the limit is thereby upgraded — from a named confound to a demonstrated fact about what this series can and cannot buy.

What survives the substitution is therefore the honest inventory, taken before any result is described. The extension survives entire, because its findings depend on the panel and the record, not on the reader's lineage: the fourth pair is admitted under the census's own rule, and the coding that follows would be the same findings under any reader. The pre-registration survives: the author's codes for both new theories, with the decision rules and the expected fault lines, were locked to file before any coder ran, so no cell in this document can be moved to fit a result the author already had. And the replication kit survives, promoted from afterthought to deliverable: the instrument verbatim, the panel, the scale, the evidence rule, the scoring scheme, and the pre-registered adjudication rules are all printed here and archived with

this run's full prompt and output, so that the alien reading can be executed by any true outsider — a human historian, or a model from another family, run by anyone, anywhere — without the author in the loop.

And one more thing survives, which the substitution itself created. A third blind run of the same family is not nothing: it extends the test-retest series, and — because it is the first reading administered after the amendments — it can ask a question neither A4b coder could. The two blind coders of A4b read the panel before any amendment existed; their readings forced the amendments in. A fresh reader now enters after the fact, and if the amendments are real corrections rather than the author's preferences, that reader — handed the original, unamended instrument — should land on the amended cells rather than on the census's originals. Do the amendments replicate blind? That is the substitution's own question, it does not require an alien to ask, and Chapter 4 answers it before anything else is claimed.

2. The Extension and the Envelope

The extension rule was pre-registered by the census itself, and its wording is the mandate this chapter executes: widen the survivor base by Volume II's method — miasma theory pairs with germ theory the moment germ theory enters the case base — and the census re-runs under the same criteria, with the same coding manual, and prints whatever differs. Germ theory enters the case base by Volume II's method for admitting residents: ratified by the world rather than by this series — a century and a half of executed medicine, vaccination, and laboratory practice — generative without any degenerative phase, and the executioner of a theory that qualifies as a control. That last clause is the admission ticket, and the fourth pair it opens is stronger on the census's criteria than any pair before it. Miasma held the etiology of epidemic and endemic disease from the Hippocratic corpus to the 1880s — over two millennia, by far the longest-lived framework in the census, dominance satisfied beyond argument. No working scientist holds foul air as the literal cause of epidemic disease, though the sanitary machinery survives in service: death of ontology, not of apparatus, the census's second criterion to the letter. And the pair shares instruments and data in the strong sense the third criterion demands — the weapon that armed the executioner was forged inside the dead program, by its own defenders, for its own questions.

The forging deserves its named evidence, because it is the structural fact that makes the pair a natural experiment. Snow's 1854 investigations ran on the General Register Office's death registrations — William Farr's archive, built in 1837 and after for the sanitary program's own purposes, with Farr, the century's leading miasmatist statistician, personally supplying the South London water-company data behind the 1853-54 comparison that cholera's signature could not survive. Snow was a founding member of the Epidemiological Society of London (1850), the sanitary movement's own institution; his question — what, specifically, is in the water — was the dead program's question asked one step too far. The Tycho-archive parallel is exact, and Table 1 prints it in the census's own form: Farr's register, assembled for the miasma program's next refinement, consumed to delete the medium. One honesty caveat is printed with the pair, because the record demands it: the miasma-to-germ transition was messier than phlogiston-to-oxygen — hybrid doctrines such as contingent contagionism, a three-decade lag from

Snow's Broad Street work (1854) to Koch's comma bacillus (1883), Pettenkofer's groundwater variant alive into the 1890s, and a sanitary program that won in practice before the etiology was settled. The census keeps the pair: the match is structural; the execution was slower; the difference is printed, per the rule, as one of the things that differs.

Dead theory (control)	Executioner (case base)	The discovery made inside the dead program
Phlogiston, 1703-1780s	Lavoisier's oxygen chemistry	Priestley's oxygen, 1774 — isolated by a loyalist, read as dephlogisticated air, handed to Lavoisier; the shared balance that weighed calcined metals
The luminiferous ether, 1678-1905	Einstein's relativity	Michelson's interferometer, built 1887 to detect the medium — the null result arming the executioner; Bradley's and Fizeau's lineage shared by both
The epicycle tradition, 150-1609	Newton's mechanics (via Kepler)	Tycho's archive — the record assembled for the tradition's next refinement, consumed by Kepler to delete the circle
Miasma theory, c. 400 BCE-1880s	Germ theory (Pasteur, Koch)	Farr's register — the General Register Office archive and sanitary infrastructure built for the miasma program's own questions; Snow's 1854 investigation ran on it, inside the Epidemiological Society the movement itself founded

Table 1 — The census under its rule, extended to four matched pairs: each discovery that armed an executioner was made inside the dead theory's own program, on its own instruments, by its own defenders.

The envelope is drawn next, and everything inside it was fixed before any coder ran. The instrument: the nine points exactly as Volume I wrote them, exemplars intact — G, c, and h named in the constant's definition, Lorentz and Schrodinger named in the formalism point's, the Bentley letter and the act of desperation in the founders' — because fidelity to the instrument the census used outranks sterilizing it, and the fame limit is thereby inherited rather than hidden: any reader who knows history knows which theories died. The scale: satisfied, partial, failed, with the slope point's compound code available. The evidence rule: every cell citing at least one named, checkable historical fact. The panel: eight theories, alphabetical, one neutral scope line each, no verdict attached — printed in Table 2 exactly as received. The forbidden list: no files read, no web searched, no lookups of any kind. And one correction new to this run: the runtime model of every coder is now logged and printed, because A4b's record never captured what its two coders ran on — a logging failure that could have hidden exactly the fact this amendment had to face.

Panel (alphabetical, as presented)	The scope line the coder received
T1 • The epicycle tradition (Ptolemaic astronomy)	The deferent-epicycle-equant mathematical astronomy from Ptolemy's <i>Almagest</i> (2nd century CE) through the Islamic and European medieval traditions to Tycho Brahe's era (roughly 150-1600).
T2 • Germ theory of disease	The doctrine that specific microorganisms are the specific causes of specific diseases — from Pasteur's fermentation and spontaneous-generation work (1857-64) through Koch's anthrax, tuberculosis, and cholera bacteriology (1876-84) to the consolidation of medical bacteriology by 1900.
T3 • The luminiferous ether	The medium of light and electromagnetism, from Huygens's wave theory (1678) and Fresnel's optics through the Maxwell-Lorentz programs to 1905.
T4 • Miasma theory of disease	The doctrine that epidemic and endemic disease arises from foul air — miasmas given off by decaying organic matter, filth, and swamp exhalations — from the Hippocratic airs-waters-places tradition through the nineteenth-century sanitary movement to the 1880s.
T5 • Newtonian mechanics	The <i>Principia</i> 's system of the world — the laws of motion plus universal gravitation (1687, editions 1713 and 1726).
T6 • Phlogiston chemistry	Stahl's theory from 1703 — combustion and calcination as release of phlogiston, metals as calx plus phlogiston — the framework of eighteenth-century pneumatic chemistry into the 1780s.
T7 • Quantum mechanics	From Planck's quantum hypothesis (1900) through the matrix and wave mechanics of 1925-27 and the Copenhagen consolidation.
T8 • Relativity	Einstein's special relativity (1905) and general relativity (1915), including their consolidation era.

Table 2 — The widened panel as the coder received it: eight theories, alphabetical, no verdict attached. The two new entries extend the census's own matched pair; the same instrument, the same scale, the same evidence rule as every prior reading.

What the third reader was, stated at the weight the mandate requires. The slot was ordered for a different family and filled by the same one: a fresh context, blind, of the author's own model family — the same class of reader A4b deployed twice, run a third time, on the widened panel. The two requests for an external family (under the names Claude opus and Claude sonnet, the only other families this environment's task router advertises) both returned the same runtime model identifier this environment reports for every subagent it spawns — the identifier of the author's own lineage, reported as glm-5.3 — and a trivial control probe returned it again. The design diagram (Figure 1) marks the slot accordingly: third blind reading, same family, alien clause unfilled. The census does not dress this up. What it does instead is extract what the run can still certify — a third independent context, the first post-amendment reading, the widened panel's first coding — and re-arm the alien clause in a form the infrastructure cannot refuse, which is Chapter 6's business.

3. The Third Blind Coding

Table 3 prints the third blind coding without commentary — seventy-two cells, each returned with its one-sentence evidence line citing a named, checkable fact, the full log archived with this run's prompt and output. Three facts are visible before any comparison is attempted. The dead side profiles low: miasma and phlogiston carry zero clean satisfied cells each, the ether and the epicycles three apiece — and miasma's profile, with six outright failures, is the weakest any dead theory has posted in any run. The compound slope code did its clean work a second time: all four dead traditions — the three physics corpses and now the oldest corpse in the history of science — read generative-then-degenerating, while no living theory does. And the living side breaks, for the first time in any reading: after one hundred eight unbroken satisfied cells across A4b's two runs, the third reading codes Newton a partial on formalism and meaning, and the quantum a partial on derivation-first — two cells in twenty-seven, both boundary cells, and both explained by the coder's own notes before the unblinding ever reached them.

Point	Epicycl es	Germ theory	Ether	Miasm a	Newto n	Phlogi ston	Quant um	Relativ ity
P1 • Deletion at birth	F	S	F	P	S	F	S	S
P2 • Unification	P	S	S	P	S	P	S	S
P3 • Universal constant	F	F	F	F	S	F	S	S
P4 • Derivation-first	P	F	P	F	S	F	P	S
P5 • Conservative embedding	F	P	P	F	S	F	S	S
P6 • Formalism / meaning	P	F	S	F	P	F	S	S
P7 • Founders' resistance	P	P	F	F	S	F	S	S
P8 • Generative slope	S then D	S	S then D	S then D	S	S then D	S	S
P9 • Crisis-chaining	P	S	S	F	S	P	S	S

Table 3 — The third blind coding of the widened panel: seventy-two cells, each with its named-evidence line archived with this run. S satisfied, P partial, F failed; the slope's compound code as the census's machinery defines it. The living side's first breaks in any reading: Newton P6, quantum P4.

The point notes are the instrument audit this exercise never commissions and cannot dismiss, and eight flags came back. The constant point is physics-shaped and ownership-loaded — a constant is credited to the frame that makes it invariant, not the frame that merely measures it, which is why Maxwell's 1865

value stays with the fields while the instrument's exemplar says 1905. Derivation-first has a two-births problem: which founding governs, Planck's 1900 interpolation or Heisenberg's 1925 rebuild from decades-old spectroscopy. Formalism and meaning conflates presence with profundity — the ether's dissociation is presence, relativity's is profundity, and the point as written pays both the same. The founders' point rests on asymmetric evidence: refusal is cheap to find, and counts as payment only when the refused coin is the successor revolution's central concept — a discriminator the coder proposed outright. The slope point needs a stipulated program unit — Newton stays satisfied only if mechanics-wide generativity counts, not the planetary program alone. Crisis-chaining needs ownership and depth criteria for the opened wound. The deletion point does not say where a 2,300-year theory's birth lies — miasma's Hippocratic birth deleted divine etiology; its nineteenth-century form deleted nothing. And unification is silent on truth: a unity can be structurally real and substantively false. Five of the eight flags replicate A4b's from a third context; three are new, and every one of them is handled in Chapter 5.

The coder's summary sentence is quoted verbatim, because the author did not commission it and could not have written it better into the extension's design: germ theory, the panel's only non-physics candidate, *fails exactly the physics-shaped points (P3, P4, P6) while scoring S on P1, P2, P8, P9 — a validity signal that three of nine points may be physics-parochial*. That sentence is the extension's thesis arriving from outside the series. The chapter that follows measures it, and the chapter after that adjudicates under it — with the pre-registered coding and its expected fault lines locked in a file the coder never saw, waiting in the dark for exactly this table.

4. The Unblinding

The comparison method is the pre-registered one, unchanged from A4b: weighted agreement scoring exact cells at one, category-adjacent cells at one-half, and outright inversions at zero, with the slope's compound code scored on its degeneration flag and the census's one non-standard entry read as partial. Table 4 assembles the numbers, and the first verdict is visible in its second row. Against the census as originally written, the third reading agrees on the dead side at 77.8 percent weighted — already higher than either A4b coder's 70.4 — with two outright inversions, both at founders' resistance, the point A4b refuted. Against the amended census — the same twenty-seven cells after A4b's ten rulings — agreement rises to 87.0 percent, and the inversions vanish. That gap is the substitution's question answered: a fresh reader, handed the original, unamended instrument, lands on the amended cells rather than on the originals the author first wrote. Every A4b amendment replicates blind — the ether's satisfied-as-written cells on formalism and crisis, its partial on derivation, the epicycles' demoted unification, the founders' refutations, the constant's failure under every reading run to date. The amendments were not the author's taste. They were in the record for any fresh reader to find, and a third one has.

The new pair, against the pre-registration: 80.6 percent weighted over eighteen cells, with the two outright disagreements both at germ theory and both at the same structural place — the physics-shaped points. On derivation-first, the pre-registration's satisfied meets the coding's failed: the theory was

established by its own new experiments — the swan-neck flasks of 1861, Koch's anthrax lifecycle of 1876, the demonstrated bacillus of 1882 — not derived from the existing record; Snow's 1855 monograph and Semmelweis's 1847 results were assimilated by the frame, not engines of its founding. On formalism and meaning, the pre-registration's satisfied — coded under the operationalized form, minted measurables — meets the coding's failed under the form as written, no symbolic surface existing to reinterpret. The disagreement is not between two readers; it is between two versions of the instrument, arriving from opposite directions at the same cell, and it is the as-written versus operationalized split demonstrated outside physics for the first time. The pre-registered fault line — E2, disagreement concentrated at the constant — fired exactly where predicted; the two distants surrounding it are the same finding's penumbra.

Comparison	Cells	Weighted	Exact / Adj / Dist
Third reading vs census v1 (dead side)	27	77.8%	17 / 8 / 2
Third reading vs amended census (dead side)	27	87.0%	20 / 7 / 0
Third reading vs A4b coder A	54	90.7%	44 / 10 / 0
Third reading vs A4b coder B	54	90.7%	44 / 10 / 0
Third reading vs pre-registration (new pair)	18	80.6%	13 / 3 / 2
Third reading vs Vol I's living profile	27	92.6%	25 / 2 / 0
A4b: coder A vs coder B (for scale)	54	94.4%	48 / 6 / 0

Table 4 — The unblinding, all readings: the third blind run agrees with the amended census at 87.0 percent and with the original at 77.8 — the amendments replicate blind. The new pair's two distants both sit at germ theory's physics-shaped points.

The living side's physics trio holds at twenty-five of twenty-seven exact, and the two breaks deserve their sentences. Newton on formalism and meaning: the coder's evidence is the post-Principia contestation — hypotheses non fingo (1713) leaving attraction without a mechanism, the Leibniz-Clarke exchange, Mach's 1883 re-reading — a formalism accepted while its meaning was fought over, which is dissociation as the point writes it; the stricter reading the coder applied requires profundity to arrive as interpretation of inherited mathematics, which Newton's was not. The quantum on derivation-first: the two-births problem in its pure form — 1900's interpolation to weeks-old measurements against 1925's rebuild from Balmer (1885) and Ritz (1908) — the h-counterexample the audit's second alarm already owns, resurfacing inside a blind reading that had never heard of it. Both breaks resolve under amendments that already exist, both dissents print with their evidence, and neither cell moves; what the breaks measure is the instrument's elasticity, now quantified — two elastic cells in one hundred thirty-five living-side readings across three runs.

The last number before the court convenes is the cluster structure, and it cuts both ways at once. The three fresh-context runs agree with each other tightly — A versus B at 94.4 percent, the third reading against each at 90.7 — far more tightly than any of them agrees with the author's original census: 70.4, 70.4, and 77.8. The outlier across all five readings of the dead side was never the lineage; it was the author's generous cells, and blinding dominates authorship within this family — a partial mitigation of the genetic sting. But the cluster is also the confirmation: three runs of one school reading thrice, converging on the same amended cells, means the amendments are the school's, and the school is what the alien clause exists to escape. Twelve of twenty-seven dead cells now carry five-way agreement — the load-bearing wall, unmoved through three blind readings and one author's revision; the fifteen that do not are the court's docket, and the docket is where the panel's newest members make their mark.

Signature point	vs census v1	vs A4b A+B	The disagreement's character
Deletion at birth	100.0%	91.7%	The ether's F/P: as-written severity against the core-posit refinement.
Unification	66.7%	95.8%	The dead's leg demotes: a posited substance is vocabulary, not law.
Universal constant	100.0%	95.8%	The sharpest row in every run — and the one that does not travel out of physics.
Derivation-first	83.3%	87.5%	The two-births problem, now named and stipulated.
Conservative embedding	66.7%	87.5%	The direction-split, applied unprompted to miasma and germ.
Formalism / meaning	83.3%	83.3%	Presence versus profundity — the coder's flag, adopted.
Founders' resistance	16.7%	83.3%	The floor again, and stricter: neither defense nor compromise priced as full payment.
Generative slope	100.0%	91.7%	All four dead traditions generative-then-degenerating; no living theory.
Crisis-chaining	83.3%	100.0%	The ether's opened drift problem, satisfied a third time.

Table 5 — Per-point weighted agreement: dead side against the census (three cells) and the full panel against the two A4b coders (twelve comparisons). The high band is the discriminating core, reproducing across runs; the floor is one point, inverted three ways now.

Figure 1 — The widened census design: the instrument handed verbatim through the envelope to a third fresh context (the alien slot, unfilled — the family is the author's own, the refusal printed); the panel widened by the census's own extension rule; the unblinding finding the amendments replicated blind; the court convening under pre-registered rules; the verdict marking the constant's domain and shipping the replication kit.

5. The Adjudication

The court reconvenes under the same rule A4b fixed before its own unblinding, and this run inherited both clauses unamended: evidence over authorship, with every contested cell tried against named historical fact; and the motion rule — where independent readings agree against the author's cell, the cell moves. The pre-registration added a third constraint this time, written before any coder ran: the expected fault lines and their permitted resolutions were locked to file, so that no ruling below can have been invented after seeing the numbers it rules on. The docket has three parts — the new pair's cells, the living side's two breaks, and the dead-side movements — and Table 6 is its ledger. The new pair is tried first, because the extension is this document's reason to exist.

Miasma, tried first. Deletion at birth: failed, and the ruling adopts the stipulation the coder's seventh note exposes as missing — for multi-century doctrines the census codes the consolidated form that held the field, which is the nineteenth-century sanitary miasma, and that form deleted nothing; the Hippocratic birth's deletion of divine etiology belongs to a different christening two millennia upstream. The coder's partial is recorded as the correct answer to the question the instrument left open — the same service A4b's coders performed on the embedding point. Conservative embedding: failed, and the pre-registration's partial moves against itself — the court's own rule executed on the author's cell. The

evidence is the coder's and it is decisive: Koch's comma bacillus (1884) and the unfiltered-Hamburg against filtered-Altona contrast of 1892 refuted miasma outright, and the surviving sanitation is craft re-founded on new reasons, not structure recovered as a limit — parity with phlogiston's deletion without remainder, not with the epicycles' Fourier. Crisis-chaining: partial stands — the environmental question the sanitary program opened, and the archive it built, remained productive for the successor, which is the demoted point's pattern among the dead. The profile after the court: zero clean satisfied cells, all five discriminators failed. The census-killing clause does not fire, and the oldest corpse in the history of science is now also the weakest resident of the control.

Germ theory, the extension's real test, and the court's rulings cell by cell. Deletion and unification: satisfied, both readings, no contest — the double deletion of spontaneous generation and foul-air etiology; the brewer's vat and the surgical ward made one (Lister's first antiseptic operation, August 1865, citing Pasteur). The universal constant: failed, both readings, the same way — no dimensionful constant exists to install, and the coder's first note names the ownership rule the court adopts: a constant is credited to the frame that makes it invariant, not the frame that measures it, and germ theory's nearest candidates — Koch's postulates, the one-germ-one-disease specificity — are criteria and taxonomic principles, not constants of nature. Derivation-first: revised to partial, split exactly as the ether's was — real promissory notes honored across a century (the specific agent for influenza in 1933, poliomyelitis in 1949), a founding carried by its own new experiments rather than derived from the existing record. Formalism and meaning: the dual cell, now doctrine — failed as written, for the theory's decisive surface was demonstration, not symbolism; satisfied operationalized, for the causal organism itself was minted: stainable (Gram, 1884), countable, cultivable (Koch's solid media, 1881; the Petri dish, 1887), with instruments built because the theory demanded them — the swan-neck flask, the autoclave, the Chamberland filter — and one coherent discriminating list, the postulates, which could and did return negative results. Founders' resistance: partial — Pasteur's surrender of the chemical-catalysis theory of fermentation he absorbed from his own formation, paid publicly against Liebig to the elder's death in 1873, is payment; Koch's tuberculin catastrophe of 1890 is a cost imposed on the theory, not a coin its maker surrendered. Slope and crisis: satisfied, no dissent — the century's unordered harvest, and the etiological wound the theory closed by opening immunology, virology, and the asymptomatic-carriage problem (Typhoid Mary, 1907) that broke the naive reading of its own postulates.

The living side's two breaks, tried and sustained as dissents with the cells unmoved. Newton's formalism cell: the evidence — attraction left mechanism-less from 1713 to Mach — is dissociation as the instrument writes it, and the stricter reading the coder applied (profundity as interpretation of inherited mathematics) is recorded as the point's genuine second sense; the flag — presence versus profundity — is adopted into the instrument's printed ambiguities. The quantum's derivation cell: the 1925 founding is derivation-first on the record — Heisenberg's rebuild from Balmer and Ritz — and the 1900 interpolation is the constant's birth story, already adjudicated by the promotion test the second amendment installed for exactly this case; the birth-window stipulation is adopted so the point never has to choose a birthday again. Neither cell moves; the elasticity itself is the finding — the instrument bends at named joints, and the joints are now documented for any future coder.

The dead-side movements, two cells, both against the author. The epicycles' founders' cell moves to partial, and the movement is the third position this point has held across three readings — the census's satisfied, A4b's refutation to failed, now a partial on evidence neither prior ruling weighed: Ptolemy's own equant compromise, uniform circular motion professed at *Almagest* IX.2 and violated at IX.5-6, a founder's real cost that Ibn al-Haytham collected in 1028 and the tradition was still paying when Copernicus built his epicyclets to restore the principle. Payment admits degrees — surrender (Newton's action at a distance, Planck's continuity), compromise (Ptolemy's equant, Lorentz's detectability), defense (none of it payment) — and the graduated scale enters the instrument with the coder's refused-coin test beside it: refusal counts only when the refused coin is the successor revolution's central concept. Phlogiston's unification cell moves to partial on the same discipline: a posited substance is not a dissolved joint, and the law-level unification of the same phenomena was Lavoisier's, achieved by deleting phlogiston rather than by positing it — the coder's evidence, matching A4b's coder B dissent that the sustained ruling had overruled one-to-one. The confound verdict now rests on the ether's leg alone, which is where A4b's narrowing already left it. Two cells move; the author is overruled in both; the ledger prints the rest.

Contested cell	Readings	The evidence the court weighed	Ruling
Miasma • deletion	F / P	The Hippocratic birth deleted divine etiology (On the Sacred Disease); the nineteenth-century form deleted nothing — Snow's evidence met with restatements.	F stands; birth-window stipulation adopted
Miasma • embedding	P / F	Hamburg unfiltered against Altona filtered, 1892 — miasma refuted outright; sanitation survives as practice, not structure.	Revised to F — the prereg moves against itself
Miasma • crisis	P / F	The environmental question the sanitary program opened, and the GRO archive it built, armed Snow and Koch — productive for the successor.	P stands; dissent recorded
Germ • derivation	S / F	Founded by its own new experiments (flasks 1861; anthrax 1876; the bacillus 1882); promissory notes honored across a century.	Revised to P — the ether's split, applied
Germ • formalism	S / F	No symbolic surface to reinterpret — but the organism minted: stainable, countable, cultivable; the flask, the filter, the Petri dish built on demand.	Dual: F as written / S operationalized
Germ • constant	F / F	No dimensionful constant to install; the nearest candidates are criteria and taxonomy, not constants of nature.	F — the point demotes to domain-marked
Newton • formalism	S / P	Hypotheses non fingo (1713) left attraction contested to Mach (1883) — meaning fought over a working formalism.	S as written; presence/profundity flag adopted
Quantum • derivation	S / P	1925 rebuilt mechanics from Balmer (1885) and Ritz (1908); 1900's interpolation is the promotion test's own case.	S stands; birth-window stipulation adopted
Epicycles • founders	F / P	Ptolemy's equant: uniformity professed (IX.2), violated (IX.5-6); the debt collected from Ibn al-Haytham (1028) to Copernicus.	Revised to P — payment graduated
Phlogiston • unification	S / P	A posited substance is not a dissolved joint; the law-level unification was Lavoisier's, by deletion.	Revised to P — the confound narrows to the ether

Table 6 — The adjudication ledger, third reading: ten cells tried, three revised (two against the author's own pre-registration), one dual, six sustained — every ruling against named evidence, every stipulation traceable to a coder's flag.

6. The Verdict: Four Plus One, and the Standing Offer

The registration, clause by clause. The census survives the widened panel: no dead theory — three physics corpses and now the oldest framework in the history of science — passes any of the five discriminators under any reading run to date, and the ether's lone as-written satisfied is the confound the audit already adjudicated. The living side admits its first non-physics resident, and the admission prices the extension's one amendment. Germ theory — ratified by the world, generative without degeneration, the unifier of the brewery vat and the surgical ward — fails the universal constant under every reading, including the pre-registered one that expected the failure and the blind one that refused to inflate the point to save it. The pre-registered resolution executes as written: the constant demotes to a domain-marked discriminator. Within quantitative physics it discriminates six for six across the census's pairs — the sharpest row in every run, one hundred percent agreement across five readings — and outside physics it abstains: it does not call germ theory shallow, it declines to speak. The alternative — restating the point as any invariant anchor of any kind — was named and rejected in advance as the first alarm's scam, an inflation fitted to the case; the anti-epicycle rule held, and the demotion is the demotion the rule permits.

The amended signature, stated whole. Four domain-general discriminators: deletion at birth, now with the core-posit and birth-window refinements; successor-recovery embedding, the direction that discriminates; generative slope, the trend; minted measurables, operationalized — the form that travels, and the one germ theory passes at full strength. One domain-marked discriminator: the universal constant, physics-relative, sharpest inside its domain and silent outside it. Two restated points, now double-restated: derivation-first as structure-not-content with the birth-window stipulation; founders' resistance as payment-not-defense, now graduated — surrender, compromise, defense — with the refused-coin test beside it. Two demoted: unification, its dead-side leg narrowed to the ether alone; crisis-chaining, blind-confirmed twice. The instrument that began as nine equal claims is now a marked map — which parts are physics, which are general, which are conditions rather than tests — and Table 7 prints it against the widened panel. Smaller, harder, and now scoped: what contact with a wider world does to an instrument fitted in one discipline.

Signature point	Phlogiston	The ether	Epicycles	Miasma	Germ theory (living)
Deletion at birth	F — renamed Becher's principle; added, deleted nothing	P * — the wave program deleted the corpuscle; its own center an inherited medium reinstated	F — extended Eudoxus; circularity never touched	F — the consolidated form deleted nothing; the Hippocratic birth was another theory's christening	S — the double deletion: spontaneous generation and foul-air etiology
Unification	P * — a posited substance is not a dissolved joint	S — one medium under optics and electromagnetism	P * — one toolkit across the planets; vocabulary, not law	P — the zymotic class: administrative, not natural	S — the brewer's vat and the surgical ward, one cause-class
Universal constant	F — no quantitative core; weight forced phlogiston negative	F — c belonged to the fields and outlived the medium	F — dozens of parameters, zero invariants	F — nothing constant; fitted coefficients that shifted each epidemic	F — domain-marked: no constant to install; the point abstains outside physics
Derivation-first	F — each new gas retrofitted, after the fact	P * — real derivational firsts; the defining note dishonored in 1887	P — parameters from centuries of records: content, never structure	F — the incumbent; data broke it rather than being derived	P * — promissory notes honored; the founding carried by its own new experiments
Conservative embedding	F — deleted without remainder by oxygen chemistry	S as written * / F on successor-rec over — Fresnel embeds ray optics; relativity recovers the ether as no limit	P — devices survive as Fourier; the ontology deleted by the ellipse	F — refuted outright (Hamburg-Altona, 1892); the surviving sewerage is craft, not structure	P — the practice recovered, the ontology deleted; no limit in which foul air causes anything
Formalism / meaning	F — no formalism; no measurable ever minted	S as written * — discriminates only operationalized (A6)	S as written * — the operationalized form discriminates	F — no symbolic surface; no unit of miasma ever named	F as written / S operationalized — the organism minted: stainable, countable, cultivable

Signature point	Phlogiston	The ether	Epicycles	Miasma	Germ theory (living)
Founders' resistance	F † — Priestley defended, paid nothing: defense is not payment	P * — Lorentz surrendered detectability, kept the medium	P * — Ptolemy's equant: a founder's compromise, collected for fourteen centuries	F — Chadwick, Nightingale, Pettenkofer's 1892 self-experiment: refusal at the price of the body itself	P — Pasteur paid Liebig his chemistry; Koch's tuberculin was a cost imposed, not a coin surrendered
Generative slope	S then D — the gas family; then negative weight	S then D — Fresnel to the interferometer; then the incoherence triangle	S then D — fourteen centuries; then the equant wound	S then D — the sanitary acts and the register; then the restatements	S — virology, immunology, antibiotics, molecular genetics: still generating
Crisis-chaining	P — opened the air questions that killed it	S as written * — closed the corpuscular crisis, opened the drift problem; demoted regardless	P — the equant objection opened its execution	P — the environmental question armed its executioner	S — closed the etiological deadlock; opened the host, the filterable agents, the carrier state

Table 7 — The census matrix after the extension and the third reading: four dead theories, the first living non-physics resident, and a signature that now says where it speaks. Cells marked * revised this run or A4b's; † refuted outright. The five-discriminator core holds on every column; the constant's column carries the domain mark.

The alien clause, settled honestly. The order was for a different model family; the environment supplies one; the probes are printed; the slot was filled by a third same-family blind reading, and this document does not claim otherwise. Genetic dependence is no longer a named confound — it is a demonstrated availability fact, and the census's honest sentence about it is that the day of the harder test has not arrived. What has arrived instead: the third reading's replication of every amendment blind, at eighty-seven percent against the amended matrix with zero inversions; the extension's amendments, pre-registered and adjudicated on evidence; and the replication kit — the instrument verbatim, the panel of eight with its scope lines, the scale, the evidence rule, the weighted scoring scheme, and the pre-registered adjudication rules, printed here and archived with this run's complete prompt and output files. Any genuinely external reader — a human historian, or a model from another family, run by anyone, anywhere — can execute the alien reading without the author in the loop, and the series' pre-registered motion rule binds the author's response in advance: where the outsider's reading and the blind readings agree against the census, the census moves. The kit converts the clause from a purchase the environment cannot make into a standing offer the world can accept — and under the series' own logic, the world's participation has always been the only evidence this corpus acknowledges it lacks. The missing reader now joins that list, in kit form, ready.

The day a genuinely alien reader recodes this panel is the day the census faces a harder test than this one.

The Independent Recoding, Chapter 6 — the clause, re-armed: that day has not arrived; the environment stocks one lineage. The offer therefore ships as a kit, for the first reader who is not of this school.

The limits, at the weight the audit taught. Genetic dependence: standing, demonstrated, and now carried by three same-family runs whose mutual tightness — 90.7 to 94.4 percent — measures the school, not the world; the A4b coders' runtime model was never logged and is presumed to be the same lineage, a presumption printed rather than hidden. The count: four pairs, eight theories, five readings per dead-side cell — still thin, still fame-confounded, and the fame residual now doubled, miasma and germ theory being the most famous pair medicine owns. The adjudicator was again the author, again mitigated by the pre-registration and the printed evidence, and again overruled where the readings agreed — two cells this time, one of them the author's own pre-registered coding, which is the point of pre-registering. What this document does not claim is the larger arc, unchanged from the first census: a coding is not the world; the signature's domain marks are confessions, not triumphs; and the world's ratification remains the only evidence this series acknowledges it lacks. The ledger is open. Continue.

4 matched pairs under the census's rule miasma admitted; germ theory enters the case base	87 percent: the third reading's agreement with the amended census against 77.8 with the original — every amendment replicated blind	0 alien readers the environment supplies genetic dependence: named, probed, standing
--	--	---

The widened census's own numbers: the panel doubled in span, the amendments replicated blind, and the one reader this series still cannot buy.
