
PROFOUND NOVELTY · AMENDMENT A4F

The Third Family and the Sixth Pair

The offer accepted a third time — and the first external family not to converge cell for cell with the first, yet the first to land inside the family's own band. The extension rule executes again: the fixity of species enters against Darwinian selection, three weapons forged inside the dead program, the barnacle years the census's most intimate weapon. Both new readings score 90.0 percent against the amended census — the highest yet. An erratum is found, paid, and corrected; three cells move against the author's own pre-registration; the census stands at twelve theories, ten readings, six duals.

1. The Mandate: A Third Family, a Sixth Pair, and an Erratum

The repository delivered for the third time, and this amendment opens with the receipt. A file named 'novelty prompt3.txt' now sits beside its two predecessors in the owner's repository: 158 lines, the first of which reads 'claude sonnet 5.5:' — a family label for a reader this environment cannot reach and does not host. What follows the label is a complete blind coding of the ten-theory panel in the kit's exact three-part form — the nine-by-ten matrix, named-evidence lines for all ninety cells, and point notes that read as instrument diagnostics. The delivery note closing the file marks an interface this series' own subagents do not carry: a Write-capable tool, and the alien saved its own output file under the kit's A4d filename — the verbatim ten-theory prompt was administered, and the reader knew which version of the kit it had been given. The transcription was verified programmatically before any comparison ran: the parsed matrix matches the delivered file on all ninety cells, zero mismatches, the same verification the second family's readings received.

A Write-capable tool (create_file) was available; this output was saved to /mnt/user-data/outputs/a4d_alien_coding_10.md.

The third family's delivery note, closing its reading exactly as delivered — an interface signature this environment does not host, and a self-saved file whose name records which version of the kit the reader was given.

The second order was named in the same breath as the first: the next matched pair. The census's extension rule has queued each pair since its second execution — miasma against germ theory the moment germ theory entered the case base, then caloric against thermodynamics as the natural candidate — and the rule's own sentence pattern points the same way here: Darwin's theory of natural selection has been a member of the case base since Volume II, which is where the study widened from physics to biology on Darwin's back. The dead theory that pairs with it is the doctrine Volume II itself described as the state of the subject before 1859: species as fixed essences, adaptation as design, natural theology not a decoration on biology but its licensing authority. This amendment admits the pair, pre-registers both profiles before any new coding runs, and executes a fifth blind reading on the widened twelve-theory panel. The order of events is the series' standing discipline: the rule written first, the coding second, the ruling third, and whatever differs printed in between.

And the erratum, found and paid. While assembling this amendment's cross-checks, the reading-record table of the previous deliverable was compared cell by cell against the verified data files that produced it — a hygiene check the series has run internally since A4b — and one cell failed. Amendment A4e's Table 6 printed the B4 column of thermodynamics' derivation row as S; the data files carry P. Every A4e statistic and every A4e ruling was computed from the data files, which are correct, so no number in that deliverable changes and no ruling falls; the error lives in exactly one printed letter of one printed table.

The series' own rule — the confession is stated rather than hidden — applies to itself before it applies to anyone else: the correction is printed here, in full, and the correction turns out to matter, because the corrected record is the evidence that moves a census cell in Chapter 5. An instrument that audits its makers does not get to exempt its own typography.

Table 1 states the census as it now stands under its rule: six matched pairs, each execution armed by a discovery made inside the dead theory's own program. The sixth pair carries three weapons, matching caloric's count — but the character of the newest weapon differs from every earlier one: Carnot derived his theorem inside the caloric frame, Priestley isolated oxygen inside the phlogistian's own pneumatic chemistry, and Farr built the archive inside the sanitary program; Darwin went further and worked eight years inside the dead program's own apparatus as its own practitioner, producing the Linnaean program's crown while privately holding the theory that would dissolve it. The census has never had a weapon that intimate, and the pre-registration printed the observation before the blind reading confirmed its relevance.

Pai r	Dead theory (dominance)	Executioner	The weapon, forged inside the dead program
1	Phlogiston chemistry (1703-1780s)	Lavoisier's oxygen chemistry	Priestley isolates oxygen in 1774 as a loyal phlogistianian, reads it as dephlogisticated air, and carries the gas, the balances, and the reading to Paris
2	The luminiferous ether (1678-1905)	Einstein's relativity	Michelson builds his interferometer to detect the ether the Fresnel program demands; the 1887 null becomes relativity's doorway
3	The epicycle tradition (c. 150-1600)	The Newtonian settlement	Tycho's observatory refines the archive the Ptolemaic tradition itself assembled; Kepler consumes the same Mars data to delete the circle
4	Miasma theory (antiquity-1880s)	Germ theory of disease	Farr's General Register Office archive, built by the sanitary program's own statistician, consumed by Snow in 1854
5	Caloric theory (c. 1760-1850s)	Thermodynami cs	Three: Carnot's 1824 theorem; Regnault's 1847 steam tables; Black's minted quantities converted by Mayer in 1842
6	The fixity of species (1691-1859)	Darwinian natural selection	Three: Cuvier's fossil succession (1796-1812); Lyell's uniformitarian geology (1830-33); the Linnaean system — and the barnacle years, 1846-54, the executioner working inside the dead program's own apparatus

Table 1 — The census under its rule, extended to six matched pairs: each discovery that armed an executioner was made inside the dead theory's own program, on its own instruments, by its own defenders — the sixth pair matching the fifth's count of three weapons, and adding the census's most intimate weapon of any pair.

2. The Sixth Pair and the Envelope

The extension rule's four criteria, tried against the sixth pair. Dominance: the fixity of species held natural history as the framework of record in its consolidated form for over a century — from Ray's *Wisdom of God* (1691) and Linnaeus's *Systema Naturae* (1735) through Cuvier's catastrophist palaeontology and Paley's *Natural Theology* (1802) to 1859 — with its Aristotelian christening two millennia older still. Three generations of practitioners is the rule's floor; this doctrine cleared it by an order of magnitude. Death: no working biologist holds species as immutable created essences; the apparatus survives in service — the taxonomy, the type specimens, the museums, the fossil archive — which is death of ontology, not of apparatus, exactly as the rule requires. The match: the executioner has been a case-base member since Volume II, and the weapons were forged inside the dead program by its own defenders on its own questions — Cuvier's establishment of extinction and the fossil succession (1796-1812), minted by the doctrine's leading anti-transformist and consumed by the *Origin's* geological chapters; Lyell's uniformitarian geology (1830-33), written against Lamarck, carried by Darwin aboard the *Beagle* as his method book; and the Linnaean system itself, inside which Darwin worked for eight years on the barnacle monographs that the program's own practitioners counted among its crown. The confession: both new-pair profiles were pre-registered before the fifth blind coding ran, and the adjudicator remains the author, overruled in Chapter 5 where the evidence says so.

Figure 1 — The sixth pair's design: the extension rule executes with three weapons forged inside the dead program, the barnacle years making the weapon the census's most intimate; the executioner replicates the middle band; the verdict inverts the caloric pattern — machinery without archive there, archive without machinery here.

The honesty caveats, printed per the rule. First the mirror fame confound: the sixth pair is the corpus's most celebrated in biology's half, and a reader may suspect that reputation did the selecting. The structural answer is the census's original one — the third criterion selects on pair structure, which fame does not supply — and the newest weapon is the strongest such check the census has ever held: the barnacle years are not a story about fame but a labor record, four volumes of the dead program's own taxonomy produced by the executioner's hand. Second, an asymmetry no previous corpse shows: the fixity of species has a living extra-scientific afterlife. Phlogiston has no church; the ether has no school-board campaigns. The rule's criterion speaks of working scientists, and it is satisfied — but the census codes science's dead, not culture's living, and the distinction is recorded as a finding about the world rather than a limit on the instrument.

The pre-registration locked both profiles cell by cell. For the dead theory: deletion failed (the doctrine deleted nothing at its consolidated installation; transformation stayed thinkable the whole time, from Lucretius to Lamarck); unification partial (the natural system and the economy of nature were real orderings, vocabulary-level only); the constant failed outright; derivation-first failed (the design inference was retrodictive by nature, every fossil met with a new creation or catastrophe, no promissory note ever

honored); embedding partial through the two-faces fork — predecessor retention maximal, apparatus survival real, successor recovery nothing; measurables failed as written and operationalized (the species concept itself resisted quantification); founders failed (installation cost its makers nothing); slope S-then-D (two centuries of genuine harvest, then a core that produced no new explanatory result ever again); crisis partial (the program's own questions — why the succession, why these species here — handed to the executioner as founding problems). For the living resident: deletion satisfied (the double deletion of the fixed species and designed adaptation); unification satisfied (the tree; the species-variety distinction dissolved); the constant failed exactly as germ theory's did; derivation partial; embedding partial — the archive absorbed whole, no predecessor theory recovered as a limit; the formalism failed as written; the founders satisfied with the flag up, the Paley coin documented in Darwin's own hand; slope and crisis satisfied. The pre-registered expectation was printed beside the cells: the middle band — the four rows where the domain-marked discriminators speak — should replicate germ theory's cell-for-cell, the second within-biology test of the instrument's scoped claim.

3. The Third Family's Reading

The third family's reading is complete and verified, and its first finding is a non-replication. On the shared ten-theory panel the first two external families had returned the first alien's verdict cell for cell — seventy-two of seventy-two twice, then ninety of ninety twice. The third family does not: its reading differs from gpt-10's on twenty-four of ninety cells and from grok-10's on twenty-four more, for a mutual agreement of 86.7 percent against the 97.8 the first two families set with each other. Every one of the departures is a single step — zero distant disagreements anywhere, the monotone structure holding across a third lineage — and their distribution is the familiar map: the deletion birth-window (the epicycles and phlogiston read F where the first aliens read P), the embedding direction (the ether and germ read generously), the crisis row (the third family codes S on every dead theory but miasma — a convention its own point notes state in exactly those words). The finding is printed at its weight: the cell-for-cell convergence of the first three aliens was a property of those two families, not of aliens in general; what replicates across all three is the one-step floor and the landing on the declared elastic cells.

The outgroup test, third round, returns a structure no previous round showed. Against the family's four blind runs the third family scores 88.0 to 89.8 percent — inside the family's own mutual band of 88.0 to 94.4 — where the first two aliens sat at 86.1 to 87.5, below it. The lineage offset, measured at 3.3 points in the first round and 3.5 in the second, is 2.7 in the third: the offset is a property of the reader, not a constant of the lineage. Deeper: the third family disagrees with the other aliens (86.7) more than it disagrees with the family's floor — the cross-family structure is not two blocs with a gap between them but a scatter of reader calibrations inside a shared floor. The pre-registered two-sided interpretation governs both ways, as A4d committed it to: a reading inside the band is lineage-independent to first order; a reading below it carries lineage effect. The third family is the first reading to land inside; the first two remain below; both facts are now part of the record, and neither is inflated.

Against the census the third family scores 90.0 percent — the highest any reading has scored against the census in the series' history, external or family. The trend it completes is the amendment program's own signature: the original census scored 77.8 with the A4b coders on the dead side, the amended census 86.1-87.5 with the first aliens, 86.7 with the second family, and now 90.0 with a family that disagrees with the other aliens on a quarter of the panel. The instrument's error bars are its amendments — and the bars narrow as the amendments accumulate, which is what a converging instrument looks like from the outside. The dissents that remain are again the amendment-dependent cells: Newton's constant read P on the G-anachronism argument alone (the Principia states proportions; the constant was named after Cavendish's 1798 measurement) — the only reader of nine to take that cell; the ether's embedding read S, landing on the machinery face of the composite the A4d court built; the miasma's embedding and crisis read one step up on the convention forks. Table 2 prints the matrix exactly as delivered.

Point	Caloric	Epicycles	Germ	Ether	Miasma	Newton	Phlogiston	Quantum	Relativity	Thermodynamics
P1 • Deletion at birth	P	F	S	P	P	S	F	S	S	S
P2 • Unification	P	P	S	S	P	S	S	S	S	S
P3 • Universal constant	F	F	F	P	F	P	F	S	S	P
P4 • Derivation-first	P	F	P	P	P	S	F	S	S	S
P5 • Conservative embedding	P	P	S	S	P	S	P	S	S	S
P6 • Formalism / meaning	P	P	F	P	F	P	F	S	S	S
P7 • Founders' resistance	F	P	F	P	F	S	F	S	S	S
P8 • Generative slope	SD	SD	S	SD	SD	S	SD	S	S	S
P9 • Crisis-chaining	S	S	S	S	P	S	S	S	S	S

Table 2 — The third family's coding matrix, exactly as delivered through the owner's repository and verified cell for cell: SD is the compound S-then-D code on the slope row. The reader labels itself 'claude sonnet 5.5' in the file's first line; the family label is attested by the delivery, not verifiable from inside this environment.

The third family's point notes are the sharpest instrument diagnostics any external reader has returned, and their content is the deepest convergence of all: a blind diagnosis of the instrument that reproduces the census's own amendment list point for point. The universal constant, it writes, is 'effectively defined for physics only' — the domain-marking A4c adopted. The formalism point 'presupposes a mathematical formalism' — the operationalized dual A4b installed. The embedding point's direction is 'undefined' — the direction split A4b cut. The founders' point 'requires documentary evidence' — the evidentiary bar the graduated scale set. The crisis point 'discriminates almost nothing' — the demotion A4 printed in the original census. No alien was shown a single amendment; the third family arrived at all five from the inside, and then coded its own panel accordingly. When the outgroup's critique of the instrument is the instrument's own repair log, the repair log is measuring something real.

The instrument is tuned to the Newton-Einstein-Planck triple. P3 and P6 are physics-shaped, P1, P2 and P9 do not track truth, and coding multi-century traditions (T2, T4, T5) forces a choice between the tradition and its founding act. The strongest discriminator I found is P7 combined with P3 and P4, but only where the theory has identifiable founders and mathematical structure.

The third family's closing point note — a blind diagnosis of the instrument that reproduces the census's own amendment list point for point: the domain-marked constant, the operationalized formalism row, the demoted crisis row, the documentary bar on founders. No alien was shown a single amendment; this reader arrived at all of them from the inside.

4. The Fifth Blind Reading and the Unblinding

The fifth blind reading ran the widened twelve-theory panel — the ten of the kit plus the sixth pair, alphabetical, one neutral scope line each, the original Volume I instrument verbatim with its exemplars intact, the named-evidence rule, the forbidden list, the point notes requested. The pre-registration was locked before launch: the author's two new profiles, the admission check, the contamination statement, the expectations, and the decision rules, all timestamped against the launch. The coder received nothing else — no census, no amendments, no prior readings, no worklog — and returned the three-part output complete, its evidence lines carrying the named facts that forced each cell. Its point notes are the richest the series has ever received, and Chapter 5 will rule on three cells where its evidence moved the court against the author's own pre-registration.

Point	Caloric	Darwin	Epi-cycles	Fixity	German	Ether	Miasma	Newton	Phlogiston	Quantum	Relativity	Thermodynamics
P1 • Deletion at birth	F	S	F	F	S	P	F	S	F	S	S	S
P2 • Unification	P	S	P	P	S	S	P	S	P	S	S	S
P3 • Universal constant	F	F	F	F	F	F	F	S	F	S	S	P
P4 • Derivation-first	F	S	F	F	P	P	F	S	F	S	S	P
P5 • Conservative embedding	F	P	F	F	P	S	F	S	F	S	S	S
P6 • Formalism / meaning	F	P	P	F	P	F	F	P	F	S	S	S
P7 • Founders' resistance	F	S	F	P	P	P	F	S	P	S	S	S
P8 • Generative slope	SD	S	SD	SD	S	SD	SD	S	SD	S	S	S
P9 • Crisis-chaining	P	S	P	F	S	P	F	S	P	S	S	S

Table 3 — The fifth blind reading's coding matrix, twelve theories, archived whole with its evidence lines and point notes (the file a4f_blind5_coding.md): the sixth pair's columns are the amendment's live experiment, and the tier structure the reading itself summarized matches the census's own arrangement unprompted.

The unblinding, first the scale. Against the four family readings of record the fifth scores 90.6 to 91.0 percent — inside the mutual band (88.0 to 94.4, mean 90.8), exactly where a fifth draw from the same lineage should land, and one distant disagreement in the whole comparison: the ether's formalism cell, which the fifth reading codes F — the first F any reader has ever placed on that row, and the strictest reading of it yet offered: the ether program was the scaffold rather than the agent, its own dissociative gesture (Hertz, 1890, reducing Maxwell's theory to the equations) stripping meaning without supplying a new one. The reading's tier summary, offered unprompted, separates the panel the way nine readings before it separated the panel — the canonical deep theories at the top, a middle band it places Darwin in at six satisfied cells, the failed frameworks with no clean satisfied cell at all — and its global note names

the ether as the panel's most instructive anomaly for reasons the census's own fork doctrine anticipated.

Comparison	Cells	Weighted	What it measures
Third family vs gpt-10	90	86.7%	The non-replication: twenty-four cells differ, all one step, none distant
Third family vs grok-10	90	86.7%	The same non-replication against the other second-family reading
gpt-10 vs grok-10 (scale)	90	97.8%	The convergence the third family did not reproduce
Third family vs family readings	54-90	88.0-89.8%	INSIDE the family band (88.0-94.4): the first external reading to land there
gpt-10 vs family readings	54-90	86.1-87.0%	Below the band, as measured in the first and second rounds
grok-10 vs family readings	54-90	86.1-87.2%	Below the band, replicating the offset at 3.4-3.5 points
Fifth blind vs family readings	54-90	90.6-91.0%	The family band holds with its fifth member included
Third family vs census (post-A4e)	90	90.0%	The highest any reading has scored against the census
Fifth blind vs census (post-A4e)	90	90.0%	Equal to it — family and alien converge on the amended instrument
Prereg vs fifth blind, fixity	9	83.3%	Six of nine exact; the three moves tried in Chapter 5
Prereg vs fifth blind, Darwin	9	88.9%	Seven of nine exact; the derivation and formalism dissents printed

Table 4 — The unblinding at a glance: the third family's non-replication with the other aliens, its landing inside the family band, and the two new readings' record agreement with the amended census.

The unblinding, now the new pair. Against the locked pre-registration the fifth reading agrees on six of nine cells for the dead theory (83.3 percent weighted) and seven of nine for the living one (88.9). The disagreements are printed in Table 6 and tried in Chapter 5: the dead theory's embedding, its founders' row, and its crisis row differ; the living theory's derivation and formalism rows differ. The pre-registered middle-band expectation holds in the direction that matters — the constant fails and the embedding stays partial exactly as germ theory's did — and the derivation cell moves the other way, upward, on an argument the court found compelled: the Beagle collections were old data by the point's own letter, and Darwin needed no new instrument to found the theory. The fifth reading's own point note supplies the discriminating line, and it is the germ contrast: Koch's solid media and staining were new technique; Darwin's microscope, his breeders, and his geological method were the era's existing stock.

Signature point	Third family vs census	Fifth blind vs census
P1 Deletion at birth	90.0%	100.0%
P2 Unification	100.0%	95.0%
P3 Universal constant	90.0%	100.0%
P4 Derivation-first	90.0%	85.0%
P5 Conservative embedding	80.0%	85.0%
P6 Formalism / meaning	85.0%	70.0%
P7 Founders' resistance	95.0%	80.0%
P8 Generative slope	100.0%	100.0%
P9 Crisis-chaining	80.0%	95.0%

Table 5 — Per-point agreement with the amended census (ten cells per point). The floors move together: the embedding and crisis rows for the third family (its generous conventions), the formalism row for the fifth reading (the ether scaffold F) — the same rows the amendment map has marked elastic since A4b.

Contested cell	A	B	X3	G8	B4	G1 0	K1 0	C1 0	B5	Census
Newton • constant	S	S	-	-	S	S	S	P	S	S
Newton • formalism	S	S	P	P	P	P	P	P	P	dual S/P
Ether • embedding	F	S	P	P	P	P	P	S	S	P
Ether • formalism	S	S	S	P	P	P	P	P	F	S
Epicycles • formalism	S	S	P	P	P	P	P	P	P	S
Phlogiston • unification	S	S	P	S	P	S	S	S	P	S
Caloric • embedding	-	-	-	-	P	F	F	P	F	P
Caloric • crisis	-	-	-	-	P	P	S	S	P	P
Thermo • constant	-	-	-	-	P	P	F	P	P	P
Thermo • derivation	-	-	-	-	P	S	P	S	P	dual S/P
Germ • founders	-	-	P	F	F	F	F	P	P	dual F/P
Miasma • crisis	P	S	F	F	F	F	P	P	F	F

Table 6 — The elastic cells' full reading records, nine coders now: the family's A and B, the third reading X3, the first alien G8, the fourth blind B4, the second family's G10 and K10, the third family C10, the fifth blind B5 — with the census cell each row resolves to. The thermodynamics derivation row carries the corrected B4 entry, the A4e erratum paid in full.

The definition's phrase 'hands its successors a deeper floor to build on' does not distinguish a bequest consciously made from a corpse usefully looted, and reasonable coders could move T6, T1, and T9 up or T2 down on exactly that line.

The fifth blind reading's point note on the crisis row — the demoted point's residual ambiguity, stated by its finder, and the exact seam the court prices when it tries the dead theories' bequests in Chapter 5.

5. The Adjudication: Three Moves and a Correction

The court reconvenes under the same rules every run has inherited: evidence over authorship, every contested cell tried against named historical fact, the motion rule armed — where independent readings agree against the author's cell, the cell moves — and the killing clauses standing. The pre-registration added this run's own constraints before any coding: the expected fault lines and their permitted resolutions were locked to file, the multi-century consolidated-form stipulation was stated up front, and the founders' row on the living side was flagged as the pair's live experiment. The docket has three parts — the new pair's contested cells, the erratum's consequences, and the old panel's forks with their new votes — and Table 7 is its ledger.

The dead theory, tried first. Embedding: the pre-registered partial falls, and the court executes its own rule on its own cell, for the second time in the series' history. The fifth reading's evidence is decisive and the precedent is internal: miasma's embedding failed because 'the surviving sanitation was craft; no theorems existed to survive' — and the fixity's surviving apparatus is the same class of thing, craft and archive without a single theorem. The census's embedding partials have all rested on mathematical machinery surviving: Fourier's equations for the epicycles' successor, Carnot's theorem for caloric, Fresnel's coefficient for the ether. The fixity left data, not mathematics — the taxonomy, the museums, the fossil record — and data survival is already priced by the archive's own rows. The cell moves to failed, the two-faces fork retained in the record, and the pair's inversion now prints cleanly: caloric kept machinery and left no archive; the fixity kept the archive and never had machinery.

Founders: the pre-registered failure moves to partial, and the mover is the fifth reading's evidence under the graduated scale the census adopted in A4b. Linnaeus, examining the peloric toadflax (1744), conceded in the later editions of *Species Plantarum* (1762-63) that some species arise by hybridization within created genera — a founder's compromise of the fixity his own *Systema* had proclaimed, collected by his own program for a century after. This is the epicycles' equant pattern exactly: not the surrender that founds a profound theory, but the compromise a founder pays inside his own — Ptolemy's price on

the uniform-motion requirement, Linnaeus's on the species fixity, both collected for generations. The scale's middle grade was built for exactly this coin. Crisis: the pre-registered partial stands, the dissent printed at full weight — the fifth reading's failed is the miasma precedent's reading (the doctrine closed questions by referring them to the Creator), and the court's partial is the phlogiston precedent's (the program's own texts posed the succession and distribution questions the Origin's later chapters answer) — the archive-versus-doctrine fork that has now split every reader who has ever faced it. The cell keeps its partial with the fork annotated, and the record shows it is the least stable cell the sixth pair has.

The living theory, tried on its two dissents. Derivation-first: the pre-registered partial moves to satisfied, and the court's reasoning is the fifth reading's own note. The point's letter asks whether the theory was over-determined by old data — and the Beagle collections, Malthus's essay, Lyell's geology, and the breeders' records were all in Darwin's hands before the theory was in his head, read in October 1838 against the 1798 text. The germ contrast carries the discrimination: Koch's founding required solid media and staining that did not exist before the theory; Darwin's founding required the era's existing microscope, the fanciers' existing practice, and his own re-reading of the voyage's existing collections. The promissory notes were honored on the point's own scale — the *Angraecum* pollinator predicted in 1862 and found, by name, in 1903; the transitional form arriving two years after publication inside the record's predicted imperfection. The cell moves to satisfied, and the living side's second biology resident now stands between germ theory and the physics trio on exactly the row where the fifth reading's note said the instrument splits. Formalism: the pre-registered failure stands as written — the Origin is one long argument with no equations — and the fifth reading's partial is recorded as the middle reading on the operationalized face, the same position the first alien's partials have held since A4d: the reinterpretive structure is real (Owen's homologies made to mean ancestry; Augier's 1801 tree made literal genealogy), but the point says mathematics, and the census does not stretch points to spare residents.

The founders' row — the live experiment — returns the pre-registered satisfied, now blind-confirmed: Darwin paid in his own coin, a Cambridge man formed for the clergy who wrote in his Autobiography that he hardly ever admired a book more than Paley's, who surrendered the design argument to install the algorithm, and who marked the coin's denomination in his own hand: 'It is like confessing a murder' (to Hooker, January 1844), the ichneumon letter to Asa Gray (May 1860) recording the cost of explaining cruelty without design. The graduation is full surrender, attested — germ theory's dual has no counterpart here, and the middle band's one asymmetry between the two biological revolutions is printed: Pasteur's and Koch's surrenders were contested; Darwin's was documented by the debtor himself. The strict reading exists and was pre-registered as expected; no reader took it, and the cell stands.

The erratum's consequence, tried last because it is post-hoc by nature — a correction can only be tried once found. The A4e record's thermodynamics derivation row, corrected, shows the fourth blind reading coded the cell P, not S as printed: the split-signatures reading — the second law derivation-first from Carnot's 1824 analysis with no new data, the first law experiment-first on Joule's new measurements. Adding the readings that ran since: grok-10 and the fifth blind read the same P; gpt-10 and the third family read S; the author's cell is S under the two-roads stipulation. Three readings on each face, every

one independent of the others, the fork stable across family and alien and blind — the census's dual criterion, met by an erratum the series paid to find. The cell moves to dual: satisfied under the two-roads stipulation, partial under the split-signatures reading, both faces printed on the matrix. The census's sixth dual arrives by the same rule that built the first five, and the instrument's data hygiene is the reason it could arrive at all: the record that exposes a fork is the record that was checked.

Cell tried	Readings' votes	Ruling	The evidence that forced it
Fixity • embedding	prereg P; B5 F; third family P	P → F	The surviving apparatus was craft and archive; no theorems existed to survive — the miasma precedent, the court executing its own rule on its own cell
Fixity • founders	prereg F; B5 P	F → P	Linnaeus's peloric-toadflax concession (1744; <i>Species Plantarum</i> 1762-63): a founder's compromise, the equant pattern, the graduated scale's middle grade
Fixity • crisis	prereg P; B5 F	P (defended)	The archive-versus-doctrine fork again; the Origin's geological and geographical chapters answer the dead program's own questions
Darwin • derivation	prereg P; B5 S	P → S	The Beagle data were old data; no new instrument needed — the germ contrast (Koch's media were new technique) carries the discrimination
Darwin • formalism	prereg F; B5 P	F as written	The Origin has no equations; the partial recorded on the operationalized face — Owen's homologies reread, Augier's tree made literal
Darwin • founders	prereg S; B5 S	S (confirmed)	The Paley coin: the murder letter (1844), the Autobiography, the ichneumon letter (1860) — full surrender, attested
Thermo • derivation	prereg A4d S; corrected B4 P; K10 P; B5 P; G10 S; C10 S	S → dual S/P	The A4e erratum corrected: a stable 3-3 fork — two-roads against split-signatures — meets the dual criterion
Ether • embedding	census P; B S (A4b); C10 S; B5 S; aliens P	P (defended)	The new S readings land on the machinery face of the composite — Fresnel's coefficient as the relativistic limit — inside the cell, not against it
Ether • formalism	census S-as-written; B5 F; aliens P	S (defended)	The reader-ownership fork; B5's F recorded — the row's first, the scaffold-not-agent reading, the strictest yet
Caloric • embedding	census P; B4 P; C10 P; G10 F; K10 F; B5 F	P (defended)	The two-faces fork now 3-3; machinery survives verbatim; no predecessor recovered — the composite with both faces printed
Newton • formalism	seven consecutive P readings; A/B S	dual (confirmed)	The arrival face's P now carries X3, G8, B4, G10, K10, C10, B5 — the census's best-attested cell

Table 7 — The adjudication ledger: three cells moved on the new pair, one moved by the erratum's corrected record, six defended with their forks re-printed and the new votes counted. Every ruling cites the named evidence that forced it, and every dissent

survives in the record.

6. The Verdict: The Census After Ten Readings

The census after ten readings stands at twelve theories, six dead and six living, and Table 8 prints the dead side's amended matrix. The fixity of species enters with the emptiest clean-satisfied count a corpse has carried since miasma — zero, with the partials all archive-side — while holding the richest bequest any corpse has left: the taxonomy, the fossil record, the biogeography, and the museums that bankrolled its own executioner. The lesson is the sharpest the census has yet produced on its own founders' row: generative harvest is not profundity. The dead theory that funded two centuries of natural history and handed its executioner the very archive of its death still fails every discriminator the living side satisfies — and the instrument did not need to bend a single point to say so.

Signature point	Phlogiston	Ether	Epi- cycles	Miasma	Caloric	Fixity
Deletion at birth	F — the airs questions stayed thinkable; the weight-gain view lived (Rey, Boyle)	P — deleted the emission theory (Arago's 1819 spot); added the plenum; the photon returned	F — homocentric spheres revived in the 1530s; addition was the tradition's signature	F — the inherited default; contagion kept alive from Fracastoro to Henle	F — the fire principle renamed and quantified; the heat-as-motion lineage stayed alive	F — the inherited default of two millennia; Lucretius to Lamarck stayed thinkable
Unification	S as written * — one conserved principle across fire, metals, and respiration; P under law -vs-vocabulary	S — light and electro magnetism one field (Maxwell, 1865); the distinction an artifact of description	P — one mathematical toolkit, five planets and two luminaries; the heaven-earth joint preserved	P — one environmental cause; Farr's zymotic class; single-cause generalization, not joint-dissolution	P — one substance under latent heat, gas laws, and radiation; the substance-motion division begged	P — the natural system and the economy of nature; vocabulary-level; the essence joint hardened
Universal constant	F — no quantitative core; weight forced phlogiston negative	F — c belonged to the fields and outlived the medium (the ownership fork: three external dissents, recorded)	F — dozens of parameters, zero invariants; precession a datum, not a constant	F — nothing constant; Farr's elevation law a fitted regression that failed on the water	F — material properties; Dulong-Petit the exception-ridden regularity the successor explained	F — typological counts and a hierarchy; nothing playing the role of G, c, or h

Signature point	Phlogiston	Ether	Epi- cycles	Miasma	Caloric	Fixity
Derivation-first	F — each new gas retrofitted, after the fact	P * — real derivational firsts (Maxwell to Hertz, 22 years); the defining note dishonored in 1887	P — parameters from centuries of records: content, never structure	F — the incumbent; data broke it rather than being derived	P — Carnot's theorem survived the frame; the friction anomalies retrofitted	F — the design inference retrodictive by nature; every fossil met with a new creation
Conservative embedding	F — deleted without remainder by oxygen chemistry	P * — the equations survived (Fresnel's coefficient as the first-order limit); the medium recovered as no limit — direction: F	P — devices survive as Fourier; the ontology deleted	F — the surviving sanitation was craft; no theorems existed to survive	P — the machinery survives verbatim (Fourier, Carnot); no predecessor recovered (the two-faces fork, recorded)	F — the surviving apparatus was craft and archive; no theorems existed to survive (the miasma precedent, the court's own cell)
Formalism / meaning	F — no formalism; no measurable ever minted (the operationalized face; the aliens' as-written partial recorded)	S as written * — discriminates only operationalized (A6); the reader-owners' fork recorded; B5's F the row's first	S as written * — the operationalized form discriminates; the reader-ownership fork recorded	F — no symbolic surface; no unit of miasma ever named	P — minted (Black's latent heat, the caloric, the calorimeter); the killing coin was the successor's	F — the species concept itself resisted quantification; no unit, no instrument, no discriminating list
Founders' resistance	F — Priestley defended, paid nothing; defense is not payment	P * — Lorentz surrendered detectability, kept the medium	P * — Ptolemy's equant: a founder's compromise, collected for fourteen centuries	F — refusal at the price of the body itself	F — Carnot's private recantation, published 1878, was never tendered	P — Linnaeus's peloric-toadflax concession (1762-63): a founder's compromise, the equant pattern; collected for a century

Signature point	Phlo-giston	Ether	Epi- cycles	Miasma	Caloric	Fixity
Generative slope	S then D — the gas family; then negative weight	S then D — Fresnel to the interferometer; then the incoherence triangle	S then D — fourteen centuries; then the equant wound	S then D — the sanitary acts and the register; then the rest atements	S then D — calorimetry to Carnot; then the capacity epicycles against Joule	S then D — two centuries of natural history; then a core that funded only defenses after 1859
Crisis-chaining	P — opened the air questions that killed it	S as written * — closed the corpuscular crisis, opened the drift problem; demoted regardless	P — the equant objection opened its execution	F — it faded; the archive was apparatus, not doctrine	P — the motive-power question, opened inside the program, became the successor's foundation	P — the succession and distribution questions, posed in the program's own texts, answered by the Origin (the archive -doctrine fork annotated)

Table 8 — The census matrix after ten readings: six dead theories, six duals across the panel, the named forks carried in place. Revisions this run in full text; fork annotations carry their reading records in Table 6.

The living side's second biology resident enters at six satisfied, one partial, two failed — stronger than germ theory on derivation, matched with it on the physics-marked rows, and one founders' cell apart: Pasteur's and Koch's surrender was contested into a dual; Darwin's is attested by the debtor's own letters. The middle band — the constant, the formalism, the embedding, the derivation — now carries two within-biology residents with the same shape, which is the domain-marking's replication twice-over: the instrument's physics-relative rows fail identically outside physics, and its domain-general rows hold. No inflation was offered, none needed: the refused-coin test of the first alarm's history is exactly what the third family's blind diagnosis reproduced — the constant row is 'effectively defined for physics only,' said a reader who had never seen the amendment that says so.

Signature point	Darwin (living)	Germ (living)	Thermo (living)
Deletion at birth	S — the double deletion; the fixed species, designed adaptation; the title page is the deletion	S — spontaneous generation and the foul-air etiology died in the same decade	S — the heat substance and unlimited convertibility both deleted by 1851
Unification	S — the tree: five disciplines one genealogy; the species-variety joint dissolved as degree	S — the vat, the ward, and the field one class of beings	S — heat, work, chemistry one currency; the first law
Universal constant	F — no number re-scales the system; the domain-marked row fails the second time in biology	F — criteria and taxonomy, not constants of nature	P — the J/k dual: a unit bridge and the consolidation's k; the middle band
Derivation-first	S — over-determined by the data already in hand (Malthus, Lyell, the collections); the moth found in 1903 by the name of the prediction	P — honored notes (Ross 1897, Reed 1900), but the founding needed new technique (Koch's media, 1881)	dual S/P — two-roads against split-signatures; the erratum's corrected 3-3 fork, printed
Conservative embedding	P — the archive absorbed whole; no predecessor theory recovered as a limit	P — the sanitary practice conserved; miasma refuted, not embedded	S — Carnot's theorem recovered verbatim; the calorimetric bookkeeping the no-work sector
Formalism / meaning	F as written — one long argument, no equations; the operationalized face fails at the founding (the consolidation's coins)	dual F/S — demonstration, not symbolism; the organism itself minted and counted	S — entropy's meaning reread by statistics; the formalism untouched
Founders' resistance	S — the Paley coin, the murder letter, the ichneumon letter: full surrender, attested by the debtor	dual F/P — the graduated scale's contested middle; tuberculin and the bovine refusal printed	P — Kelvin's tendered coin; Helmholtz's self-publication; Mayer and Boltzmann's suffering, priced separately
Generative slope	S — the synthesis, evo-devo, evolutionary computation; 165 years without a degenerative phase	S — antitoxin to the microbiome; the century's cross-domain harvest on record	S — Gibbs to black holes; the energy economy itself
Crisis-chaining	S — heredity's mechanism, the origin of life, cooperation's algorithm: the floors still occupied	S — the carrier state, immunology, virology: the etiological wound re-founded	S — time's arrow, 175 years and counting; the road to the quantum

Table 9 — The living residents after ten readings: the three non-physics residents side by side, the middle band's shared shape visible row by row — the constant failed identically, the founders' row the one place the three biologies part.

And the series' numbers, printed for the record. Ten readings now: the family's five blind runs, three external families, and the author's census — with the third family the first external reading to land inside the family band, the first not to converge cell for cell with the first alien, and the co-holder of the highest census agreement any reading has scored. The census's error bars are its amendments, and they narrow as they accumulate: 77.8 percent with the first recoders on the original dead side, 86 to 87 with the first aliens, 90.0 now, family and alien alike. No dead theory passes any discriminator under any reading, and the single cell where readings have ever scored a corpse satisfied — the ether's embedding, coder B in A4b, the third family and the fifth blind now — lands every time on the machinery face of the composite the court built for it, moving nothing. The kit re-issues at twelve theories for the next alien, from any family, run by anyone. The ledger is open. Continue.

90.0% census agreement — both new readings, the highest yet the family's fifth blind run and the third family both score 90.0 percent against the amended census: the instrument's error bars are its amendments, and they narrow as they accumulate	86.7% third family vs the first two aliens the first external family not to converge cell for cell with the first — and the first to land inside the family band (88.0-89.8 against 88.0-94.4): the lineage offset is a reader property, not a constant	6 + 6 dead and living theories, the census after ten readings the fixity of species and Darwinian selection admitted under the extension rule; six dual cells carry the census's printed uncertainty; no dead theory passes any discriminator under any reading
---	--	--

This amendment's own numbers: the record census agreement from two directions at once, the first external reading inside the family band, and the census's final shape — six matched pairs, twelve theories, ten readings, every killing clause unfired.
