
PROFOUND NOVELTY · AMENDMENT A4G

The Fourth Delivery and the Seventh Pair

The offer accepted a fourth time — by three readers at once: deepseek, opus, and gemini 3.1 pro preview, the first multi-family delivery, and the first distant disagreements ever to appear between external families — nine in all, every one on a cell the census had already marked as a fork. The extension rule executes into the earth sciences: the fixity of the crust enters against plate tectonics, three weapons forged inside the dead program's own surveys. The sixth blind reading scores 91.2 percent against the census — the highest of any reading yet — and confirms the plate pre-registration nine cells for nine. The census stands at fourteen theories, thirteen readings, nine duals.

1. The Mandate: Three Families at Once, and a Seventh Pair

The repository delivered for the fourth time, and this time it brought a crowd. A file named 'novelty prompt4.txt' now sits beside its three predecessors at the owner's repository root: 645 lines, 83 kilobytes, and not one reading inside it but three — the first multi-family delivery in the series' history. The labels are the owner's, printed at each section head: 'deepseek:' opens the file; 'opus inline:' and then, a second time, 'opus a4f_alien_coding_12.md:' carry one reader's output twice over; 'gemini 3.1 pro preview:' closes it. What follows each label is a complete blind coding of the twelve-theory panel in the kit's exact three-part form — the nine-by-twelve matrix, named-evidence lines for all one hundred and eight cells, and point notes that read, once again, as instrument diagnostics. The delivery notes mark the interfaces this series' own subagents do not carry: deepseek and gemini report no Write tool available in their environments and deliver their outputs inline; opus reports a file-writing capability was available and that the identical output was saved as a4f_alien_coding_12.md — and this amendment's parser verified the identity claim itself, cell by cell, one hundred and eight for one hundred and eight. The saved-file delivery carries UTF-8 mojibake on its accented characters (TraitÃ© for Trait  ), the mark of a second transcription path this environment does not host; the provenance caveat stands as always — the family labels are attested by the owner's delivery, not verifiable from inside this environment.

Overall, the instrument risks being circular. Most of the definitions are written around Newton, Einstein and Planck, so those theories score near-perfect partly by construction. The most useful points across disciplines were P1, P2, the trend half of P8, and P9.

— The fourth delivery, the opus reading's point notes, delivered blind: the instrument's circularity diagnosis, reproduced unbidden by the fifth external lineage

The blinding conditions are attested in each reader's own delivery note, in the words the kit itself demands: coded from the reader's own knowledge only, no web search, no files read, no worklog touched. The transcription was verified programmatically before any comparison ran — the parsed matrices match the delivered text on all three hundred and twenty-four cells, zero mismatches, the same verification every alien reading has received since the second family. With three external families arriving in one delivery, the outgroup test doubles its panel in a single stroke: six external lineages now stand against the family's six readings, and the census's own record grows to thirteen coders. The treatment of all three is governed by rules locked before any alien ever ran (A4c Chapters 2 and 5, restated by each amendment since): evidence over authorship; where the outsider and the blind readings agree against the census, the census moves; the census-killing clauses stay armed.

The second order was named in the same breath, as it has been each time: the seventh pair. The census's extension rule has queued every pair since its second execution — miasma against germ theory the

moment germ theory entered the case base, then caloric against thermodynamics, then the fixity of species against Darwinian selection — and the rule's own sentence pattern points the same way here, further from physics than the census has ever reached. Plate tectonics has been a member of the case base since Volume II, which is where the study widened from physics into earth science on Wegener's back: Volume II's second chapter tells the drift story as one of its seven expansion cases, and Volume II's own conclusion names the constitutive deletion on offer — 'the fixity of the crust' — as the thing the 1960s revolution took. The dead theory that pairs with the executioner is the doctrine Volume II described as the state of the subject before 1962: continents and oceans permanent in position, mountains built by geosynclinal subsidence and a cooling contraction, trans-oceanic disjunctions bridged. This amendment admits the pair, pre-registers both profiles before any new coding runs, and executes a sixth blind reading on the widened fourteen-theory panel — the panel growing by appenditure this time, T13 and T14 added after the twelve, so that every citation of every prior reading keeps its number.

The mandate, then, is the series' standing two-part order, executed at its widest: process the fourth delivery under the locked rules, and extend the census by its own rule into the earth sciences. Table 1 states the census as it now stands under its rule, seven pairs deep. What follows is the receipt, the pair, the readings, the unblinding, the adjudication, and the verdict — in the series' order, under the series' constraints, with every dissent printed.

Pai r	Dead theory (dominance)	Executioner	The weapon forged inside the dead program
1	Phlogiston chemistry (1703-1780s)	Oxygen chemistry (Lavoisier, 1780s)	The pneumatic chemistry the doctrine itself sponsored — Black, Cavendish, Priestley and Scheele isolating the airs that replaced it
2	The luminiferous ether (1678-1905)	Relativity (1905)	The Maxwell-Lorentz formalism — the equations the executioner kept while deleting the medium they were about
3	The epicycle tradition (c. 150-1600)	Newtonian mechanics (1687)	The mathematical astronomy itself — the computing tradition Copernicus and Kepler inherited rather than overthrew
4	Miasma theory (antiquity-1880s)	Germ theory (1876-84)	Farr's General Register Office and the Epidemiological Society — the mortality statistics that could be counted and, once counted, decided against foul air
5	Caloric theory (c. 1760-1850s)	Thermodynamics (1850)	Carnot's 1824 theorem, Regnault's precision tables, Black's minted quantities — the strongest forging in the census
6	The fixity of species (1691-1859)	Darwinian selection (1859)	Cuvier's fossil succession, Lyell's Principles carried on the Beagle, the Linnaean system worked in the barnacle monographs
7	The fixity of the crust (1857-1960s)	Plate tectonics (1962-68)	Lamont's own survey vessels minting the ridge maps, the seismic networks minting the Wadati-Benioff zones, the establishment's paleomagnetism minting the reversal clock

Table 1 — The census under its rule, extended to seven matched pairs. The earth sciences enter with the seventh pair; the executioner column now spans physics, chemistry, biology, medicine, and the crustal sciences.

2. The Seventh Pair and the Envelope

The extension rule's four criteria, tried against the seventh pair before any coding ran. CR-1, dominance: continental fixism was the framework of record of the earth sciences for over a century in its consolidated form — the geosynclinal program from Hall's 1857 address and Dana's Manual (1873) through the land-bridge biogeographies and the contractionist orogenies to the American institutional consensus of the 1950s. The 1926 Tulsa symposium assembled the discipline's leadership — Chamberlin, Willis, Berry, Longwell — expressly to bury Wegener's drift, and succeeded for a generation; the settlement was not a decoration on geology but its licensing authority, holding the surveys, the journals, and the departments. CR-2, death: no working geologist defends immobile continents; permanence died between Hess's 1962 essay and the Vine-Matthews confirmations, and by the 1968 Penrose conference the field had crossed whole — death of ontology, not of apparatus, the map and the timescale surviving in service. CR-3, the match: the pair shares instruments and data in the strong sense the census demands — the weapons were forged inside the dead program, by its own institutions, on its own questions. CR-4, the confession: this coding was pre-registered before the sixth blind reading ran; the adjudicator remains the author, mitigated by checkable evidence and overruled where the readings agree against him.

Figure 1 — The seventh pair's design: the earth sciences enter the census, three weapons forged inside the settlement, and the living side's pre-registration confirmed nine cells for nine by the blind reader — the series' first living-side exact.

The weapons deserve their names, because the pair's intimacy is institutional. First, the oceanographic establishment's own surveys: Ewing's Lamont — the fixist era's leading oceanographic institution — sent the Vema cruises whose bathymetric and seismic-refraction profiles minted the mid-ocean ridge maps (Heezen and Tharp's world-rift map was drawn on a fixist institution's drawing boards) and the thin-crust data that Hess's 1962 essay reread as seafloor spreading. Second, the era's seismic networks — the worldwide standardized seismology of the ISS and the post-war monitoring arrays — which minted the deep-focus earthquake zones of Wadati (1928) and Benioff (1949-54) that became the subduction slabs. Third, paleomagnetism and the geomagnetic reversal timescale — Runcorn's polar-wander curves (1956), the Cox-Doell-Dalrymple reversal chronology (1963) — minted inside establishment geophysics, and reread by Vine and Matthews (1963) as the tape recorder of spreading. The executioner's data were the dead program's own mint: the ridge was mapped, the trenches were zoned, and the reversal clock was built, all before the settlement fell — by the settlement.

The honesty caveats, printed per the rule. First the mirror fame confound, again: the 1960s revolution is the textbook case of geology, and Wegener is the discipline's most celebrated martyr. The structural answer is the census's original one — the third criterion selects on pair structure, which fame does not

supply: Lamont's own vessels minting the ridge maps, the monitoring nets minting the Wadati-Benioff zones, and the establishment's own paleomagnetism minting the reversal clock are checkable as weapons-forged-inside. Second, the two-corpses asymmetry, printed as a finding about the world rather than the instrument: Wegener's own theory died too. The vindicated theory is not the precursor returned — Hess's spreading ocean floor rides the mantle it makes, and the continents do not plow through it; drift was vindicated transformed, by its grandchildren. The pair's dead side is the settlement that rejected the precursor, not the precursor itself; the precursor's fate is E8's residual, not a coding cell. Third, the afterlife check: unlike the fixity of species, this corpse is cold in both worlds — no extra-scientific wing defends immobile continents — and CR-2 is satisfied with margin. Fourth, the scope note: the panel's first earth-science theories take the census's domain coverage to physics, chemistry, biology, medicine, and now the crustal sciences — the domain-marked rows face their farthest test.

The pre-registration locked both profiles cell by cell, from the historical record, before the sixth blind reading existed. For the dead side — the fixity of the crust, coded in its consolidated form (Hall 1857 to the 1950s consensus, the multi-century convention applied) — the author locked F P F F P F F SD P: deletion F (the settlement installed nothing; the drift alternative stayed thinkable the entire window, published in the field's own journals and answered at its own symposia), unification P (vocabulary-level: one framework ordered the crust — geosynclines, land bridges, contraction — but the continents/oceans distinction was asserted as permanent, not dissolved), the constant F, derivation F (content retrofits without limit: each disjunction got its own bridge), embedding P with the machinery face printed — isostasy, Airy 1855 and Pratt 1859, minted from the India survey's deflection anomalies inside the vertical-tectonics era, survives into plate tectonics as the plates' flotation mechanics, the theorem-like bequest the species fixity lacked — against the direction face F, no predecessor recovered as a limit; measurables F as written with the operationalized isostasy noted; founders F (the 1926 campaigns were defense at the outsider's price, not payment); slope SD (a real generative phase — the mapping of the continents, the timescale, the surveys, the very oceanography that killed it — then the degenerating ratchet from 1956); crisis P (the surveys minted the questions the executioner answered). For the living side, plate tectonics, the author locked S S F P P P P S S — the full middle band, P3 through P7, expected to replicate the biology residents cell for cell, with P6 and P7 flagged as the amendment's live cells. Figure 1 states the design.

3. The Fourth Delivery's Three Readings

Three readings arrived at once, and the first finding is about them, not the census: the first multi-family delivery does not converge cell for cell. The first two external families agreed with each other at 97.8 percent and each at 100 percent with the first alien's smaller-panel reading — a convergence so tight it was itself a datum. The third family broke the pattern gently (86.7, twenty-four departures, all one step). The fourth delivery's three mutual agreements land at 85.2, 85.6, and 85.6 percent — the claude band, but with a new feature: nine distant disagreements among them, the first two-step splits between external readers ever recorded. The nine distant are not scattered noise. Every one of them lands on a cell the census had already marked as a fork: the ether's deletion and constant and embedding (gemini's S against deepseek's F, twice, and opus between), the caloric's formalism cell (deepseek's S against opus and gemini's F), Newton's formalism cell (gemini's F against deepseek's S), and Darwin's derivation (gemini's F against the other two's S). The amendments' map predicted where readers part; the first distant in the series' cross-family record arrive exactly on the marked cells. The census's error bars are its amendments — and now its error bars have error bars of their own, printed as nine named cells.

The three families' relationships to the prior aliens and to the census are each distinct, and the distinctions carry information. Opus lands closest to the prior external record — 91.7 with gpt-10, 91.7 with grok-10, 90.6 with claude-10 — and against the census at 89.8 percent with zero distant cells. Deepseek and gemini land in the 83-86 range against the prior three, and against the census at 90.7 and 86.6 respectively — deepseek with zero distant cells, gemini carrying the delivery's four distant against the census, all four on the same marked forks (the ether's constant, Darwin's derivation, and the two formalism cells). The per-point bands tell the same story with the instruments' own grain: P8's slope row agrees at 95.8 to 100 percent across all four new readings — the point every family reads the same — while P4 and P6, the declared elastic rows, spread from 70.8 to 91.7. The point notes of all three reproduce the census's own amendment list blind: all three diagnose the constant as physics-only; deepseek and opus flag P8's scope window; gemini flags the constant's value-versus-universality conflation and P9's fatal-anomaly-versus-open-problem fork; opus flags P4's two-tests bundle and P7's timing rule. That is now eight lineages — five external — diagnosing the instrument's own amendment list without being shown it.

Each reading has its own signature, and each signature lands on the census's declared soft spots. Deepseek's is the machinery reading: it gives the caloric an S on the formalism cell — the Fourier-equation survival read at full strength, alone of nine readers on that cell — and it gives the ether an S on the same row, the Lorentz-held-equations face. Opus's is generosity toward the dead: it reads P on the deletion cell of four corpses at once (epicycles, fixity, miasma, phlogiston — the christening-window reading, crediting each dead framework with the deletion its own installation performed on its predecessor), joins claude's G-anachronism dissent on Newton's constant, and gives the fixity of species five partial cells, the most generous row any reader has given the emptiest corpse. Gemini's is the ether itself: it scores the luminiferous medium S on deletion (Young and Fresnel deleted the corpuscles), S on the constant (Maxwell established c), and S on embedding (ray optics as the short-wavelength limit) —

the first reading in series history to score a corpse S on three of the five discriminators at once, the deepest single-reading challenge the killing clauses have ever faced. Tables 2 through 4 print the three matrices verbatim, in the series' convention; the adjudication tries gemini's ether line cell by cell, and the trials are Chapter 5's business.

Point	Caloric	Darwin	Epicyles	Fixity	German	Ether	Misasm	Newton	Phlogiston	QM	Relativity	Thermodynamics

Table 4 — The sixth external lineage, gemini 3.1 pro preview, printed verbatim. Its signature: the ether line — deletion S, constant S, embedding S — the first reading in series history to score a corpse S on three of the five discriminators at once, the deepest single-reading challenge the killing clauses have faced; tried cell by cell in Chapter 5, and every dissent of the three new families' nine distants visible in these rows.

I coded the theory's own novelty at birth, not its later fate. T1 and T9 expose this most sharply. [...] Every refuted theory in the panel scored 'S then D', so I don't think P8 is measuring depth.

— The fourth delivery, the deepseek reading's point notes, flagging the slope row's scope window — the census's own A4c stipulation, found blind by the fourth lineage

4. The Sixth Blind Reading and the Unblinding

The sixth blind reading ran under the same envelope as the five before it: one general-purpose subagent in a fresh context, the original Volume I instrument verbatim with its exemplars intact, the S/P/F scale with the SD compound for the slope row, the named-evidence rule, the forbidden list — no files, no web, no worklog — and the point notes requested. The panel widened to fourteen theories, and the widening was by appenditure: the twelve of the A4f kit kept their numbers — the fourth delivery had itself just coded them in that order — and the seventh pair entered as T13 (the fixity of the crust, with its consolidated-form scope line and the drift precursor expressly outside it) and T14 (plate tectonics, from the 1962-68 consolidation through the ocean-drilling era). The reading came back complete: the nine-by-fourteen matrix, named evidence for every one of the hundred and twenty-six cells, and point notes of the series' accustomed candor. Its subagent identifier and runtime lineage are logged in the work record; its output is archived whole, as every blind reading has been.

Point	Ca lor ic	Da rw in	Ep i- c ycl es	Fi xit y	Ge rm	Et he r	Mi - a sm a	Ne wt on	Ph lo- gis ton	Q M	Re la- tiv ity	Th er mo	Cr ust	Pl ate

Table 5 — The sixth blind reading's coding matrix, fourteen theories, the original instrument verbatim, no files and no web. The two rightmost columns are the seventh pair; the thirteenth is the emptiest corpse column of any blind reading, and the fourteenth matches the locked pre-registration nine cells for nine.

The family band holds with its sixth member, and now runs tighter. B6's agreements with the five prior family readings — the A4b pair, the third, fourth, and fifth blind readings — run from 90.7 to 93.8 percent, mean 92.5, all inside the standing band (88.0-94.4, mean 90.8) and none of them carrying a single distant disagreement except one: the ether's formalism cell, where B6's S returns to the census's side of the row B5 had broken with its F. Against the census itself, B6 scores 91.2 percent on the shared twelve — the highest agreement any reading, family or alien, has ever scored against the amended census — with zero distant cells. The series' amendments have been converging the instrument for six rounds now: the blind readings scored 77.8 against the original census, 86 against the amended, 90.0 at the last round, 91.2 now. The trajectory is the instrument's own error bar shrinking in public.

Comparison	Cells	Weighted	What it measures
B6 vs the five prior family readings	54-108 each	90.7-93.8 (mean 92.5)	The family band's sixth member — all inside 88.0-94.4; one distant in the whole set (the ether's formalism cell, returning to the census's side)
B6 vs census (post-A4f)	108	91.2 — zero distant	The highest reading-versus-census agreement in series history; the amendments converge the instrument (77.8 to 86 to 90.0 to 91.2 across six rounds)
DEEPSEEK vs census	108	90.7 — zero distant	The fourth family's first reading, and the first external reading with zero distant cells against the amended census
OPUS vs census	108	89.8 — zero distant	The fifth external lineage; the closest to the prior aliens (91.7 with gpt-10, 91.7 with grok-10)
GEMINI vs census	108	86.6 — four distant	The sixth external lineage; all four distant on cells the census had marked as forks (the ether's constant, Darwin's derivation, the two formalism cells)
The three new families, mutually	108 each	85.2 / 85.6 / 85.6	The first multi-family delivery does not converge cell for cell: nine distant disagreements — the first ever between external families, every one on a marked fork cell
Six aliens vs the family readings	36 pair ings	means 86.5-90.6	The outgroup test v4: deepseek lands inside the family band (90.6), the first external reading to do so clearly; the lineage offset spans zero to ~4.5 points across six families — a reader property, not a constant

Table 6 — The unblinding at a glance: the fourth delivery's three readings and the sixth blind reading, against the family, against one another, and against the amended census.

The outgroup test's fourth round is the widest ever run: six external families against six family readings, thirty-six pairings. The aliens-versus-family means now read: gpt 86.5, grok 87.1, claude 88.0, deepseek 90.6, opus 87.7, gemini 87.9 — and deepseek's 90.6 lands inside the family band, the first external reading to do so clearly (claude touched the floor at 88.0). The lineage offset — the gap between an external family and the reading family's own mutual agreement — now spans essentially zero to about four and a half points across six families. The offset was revealed as a reader property in the third round; the fourth round shows its full range. There is no alien family; there are six external lineages, each with its own distance from the family that coded the original census, and the census's verdicts — which no reading has ever inverted on any killing clause — are now over-determined by readers this environment did not select and cannot reach.

Signature point	Deep-seek	Opus	Gemini	B6 (blind)	Floor and ceiling
P1 Deletion at birth	91.7	79.2	95.8	100.0	B6 perfect on deletion; opus's generosity reads the christening windows
P2 Unification	95.8	100.0	91.7	83.3	B6's strict vocabulary bar (caloric and phlogiston dissents, printed)
P3 Universal constant	100.0	91.7	87.5	95.8	gemini's ether-constant S — the value-installed conflation, tried in Chapter 5
P4 Derivation-first	87.5	79.2	70.8	91.7	The elastic row spreads widest; gemini's Darwin F — its own two-tests note
P5 Conservative embedding	83.3	91.7	79.2	91.7	deepseek's ether F against the census's composite
P6 Formalism / meaning	87.5	75.0	75.0	91.7	The row that mints the two new duals; deepseek's caloric S — the machinery reading, alone
P7 Founders' coin	79.2	95.8	87.5	79.2	The timing rule spreads the families (Priestley's defense read as payment)
P8 Generative slope	95.8	100.0	100.0	95.8	The row every family reads the same; B6's Darwin SD — the scope line, quoted
P9 Crisis-chaining	95.8	95.8	91.7	91.7	gemini's epi S — the wound-as-floor reading, tried and declined

Table 7 — Per-point agreement with the amended census (percent, twelve cells per point): the slope row saturated, the elastic rows spread — and every spread lands where the amendments said it would.

Contested cell	A	B	X 3	G 8	B 4	G 1 0	K 1 0	C 1 0	B 5	D	O	G	B 6	Census

Table 8 — The elastic cells' full reading records, thirteen coders: the two family pairs (A, B), the third blind reading (X3), the first alien (G8), the fourth and fifth blind readings (B4, B5), the first three external families (G10, K10, C10), the fourth delivery (D, O, G), and the sixth blind reading (B6). The last two rows print the seventh pair's pre-registration against the blind reader's votes.

Most candidly: T2's code is decided by the scope clause — exclude the modern synthesis (as instructed) and the eclipse of Darwinism terminates the arc at 'S then D'; include it and the answer is S. A scope line is doing philosophical work here.

— The sixth blind reading, point notes: the Darwin slope dissent, printed with its reasoning — the miasma lesson running in reverse, and the reading recorded

5. The Adjudication: Two New Duals and a Defended Composite

The seventh pair's adjudication first, under the rules locked before the blind reading ran. On the living side there was nothing to move: the sixth blind reading confirmed the pre-registered plate tectonics profile nine cells for nine — the series' first living-side exact, and the second perfect pre-registration of any kind (the caloric, the strongest corpse, was the first, five readings ago). The middle band replicated in earth science as the pre-registration said it would: the constant F, exactly where the domain-marking puts every discipline outside physics; derivation P (the theory over-determined by old data — Hess's essay built on the fixist surveys' own profiles — but carried by decisive new instruments, the towed magnetometers and the Eltanin profiles); embedding P (the archive absorbed, isostasy retained, no predecessor recovered as a limit); and the formalism cell P, on the data-rereading face — the anomaly maps and the reversal chronology held by the dead program, reread as the tape recorder — the first non-physics resident in the census whose founding act is itself a rereading of held maps. The founders' cell P, the graduated scale's compromise denomination: Wilson's documented reversal against his own prior record, Hess's surrender of the mechanism-demanding standard he was trained in, against the strict payment reading — the young founders held nothing the theory asked them to give up, as the blind reading's own note says.

The dead side gave the court three cells to try, all three of them the pre-registration's partials against the blind reader's F's. The unification cell moved: crust P2, P to F, on the blind reading's vote and the miasma precedent — the geosynclinal vocabulary assumed the very divisions (continents, oceans, permanent

both) that an ordering should have been ordering; it lumped where the fixity of species' natural system actually ordered, and the census prices the difference between a vocabulary and a unification at exactly one cell. The embedding cell did not move to F, but the fork forced a dual: the pre-registration's P rested on the isostasy bequest — Airy and Pratt's compensation doctrine, minted from the India survey's deflection anomalies inside the settlement's own era, surviving into plate tectonics as the flotation mechanics of the plates themselves, a theorem-like bequest the species fixity never had — and the blind reading's F rested on the ownership question (isostasy was the geodesists' answer to a question the doctrine posed, not the doctrine's own machinery, and the doctrine's own machinery — geosynclines, contraction, bridges — died without recovery or limit). The court split the cell as it split thermodynamics' derivation: dual P/F, the machinery face and the ownership face, both printed. The crisis cell held as P: the settlement's own surveys minted the questions its executioner answered — why the ridge runs the ocean's middle, why the stripes are symmetric, why the deep quakes line the trenches — and the fixity-of-species precedent governs (the instruments minted the questions; the doctrine could not answer them). The blind reading's F — a terminus, the deep questions opened by the successor against it — is printed as the dissent.

The old panel's adjudication, under the motion rule. The fourth delivery's three readings and the sixth blind reading together forced two new duals out of the formalism row, both on the readers' own convergence. The ether's formalism cell: the census has carried S since the original coding — the instrument's own exemplar, Lorentz held the equations, Einstein re-read them — and the readers have now split five ways across thirteen coders into a stable structure: the S-face (the held-equations reading: the two A4b coders, the third blind reading, deepseek, and the sixth blind reading), the P-face (the who-did-the-rereading reading: seven readers from the first alien through gemini), and B5's lone F (the scaffold rather than the agent). The court minted the dual it minted for Newton's cell three amendments ago: S as written, P on the agent face — the ether held the equations and never re-read them; the profundity of the re-reading was Einstein's, and the medium was the scaffold, not the reader. The epicycle tradition's formalism cell, S since the original census on the save-the-phenomena institutionalization and the machinery's afterlife as Fourier analysis, splits the same way — the P-face now ten readers strong, gemini's F alone beneath it — and takes the same dual: S on the formalism-outlived-meaning face, P on the tradition-performed-no-rereading face. The row's pattern is the finding: every historical formalism cell the census holds forks on the same agent question, and the fourth delivery's distants arrived exactly there.

The rest of the docket, defended with every dissent printed. The ether's embedding cell held its composite against gemini's S and opus's S joining it: the fork now reads six S, six P, one F, and the S votes land on the machinery face of the A4d composite — ray optics as the short-wavelength limit — inside the cell, not against it. Gemini's ether line as a whole — the deepest single-reading challenge ever, three discriminator S's for one corpse — was tried cell by cell and declined on the documented rulings: the deletion S credits the wave program's corpuscular deletion to the medium the program added (the census's composite P carries it); the constant S is the value-determined-versus-universality-installed conflation, governed by the A4c ownership rule — c's universality is Einstein's act, and the blind

reading's own point note names the conflation; the embedding S is the machinery face, inside the composite. The killing clauses do not fire: no dead theory's census cell is S on any of the five discriminators, and the first reading to score a corpse S on three of the five moves no census cell. Newton's constant kept its S against the G-anachronism fork, now two readers of thirteen. Quantum mechanics' derivation kept its S against opus's P, the cell's second dissenting vote in thirteen readings. Darwin's slope kept its S against the sixth blind reading's scope-faithful SD — the dissent printed with its own reasoning, the scope clause quoted. Darwin's derivation kept its S against gemini's F, the two-tests-bundle dissent its own note names. The fixity of species' three contested cells all held (P7's Linnaeus concession against a now three-two fork; P9's archive-versus-doctrine fork at three-two the other way; P4's method-showpiece reading against opus's Cuvier-in-hours P). Miasma's crisis and unification held; thermodynamics' J/k middle band held against gemini's S; the caloric's formalism cell held its P against deepseek's S — the Fourier-machinery reading at full strength, alone of nine readers on that cell, printed as the cell's strongest machinery vote. The full ledger is Table 7.

Cell tried	Readings' votes	Ruling	The reasoning
Crust P2 (unification)	prereg P · B6 F	MOVED to F	The miasma precedent: a vocabulary that assumed the divisions it should have ordered — the geosyncline never achieved the field-wide ordering the natural system did
Crust P5 (embedding)	prereg P · B6 F	DUAL P/F	The isostasy bequest is real (B6's own plate column attests the survival) but its ownership is the geodesists', not the doctrine's; the doctrine's own machinery died without recovery or limit
Crust P9 (crisis)	prereg P · B6 F	DEFENDE D as P	The surveys minted the questions (the ridge, the stripes, the deep quakes) — the fixity-of-species precedent exact; the terminus reading printed as the dissent
Plate, all nine cells	prereg = B6, 9/9	CONFIRM ED	The series' first living-side exact pre-registration; the middle band replicates in earth science, P6 landing on the data-rereading face — the first non-physics resident whose founding act is a rereading of held maps
Ether P6 (formalism)	S-face 5 · P-face 7 · F 1	MOVED to dual S/P	The readers' convergence forces the Newton-pattern fork: S as written (the instrument's own exemplar — Lorentz held the equations), P on the agent face (the re-reading was Einstein's; the medium was the scaffold, not the reader)
Epicycles P6 (formalism)	S-face 2 · P-face 10 · F 1	MOVED to dual S/P	The same fork: S on the formalism-outlived-meaning face (the machinery became Fourier analysis), P on the tradition-performed-no-rereading face (the profundity was Copernicus's)
Ether P5 (embedding)	S 6 · P 6 · F 1	DEFENDE D as P	The A4d composite holds: the S votes land on the machinery face (ray optics as the short-wavelength limit), inside the cell, not against it

Cell tried	Readings' votes	Ruling	The reasoning
Ether P1, P3 (gemini's line)	P1: G S · P3: G S	DEFENDE D as P and F	The deepest single-reading challenge ever: P1's S credits the wave program's deletion to the medium the program added; P3's S is the value-versus-universality conflation the ownership rule governs (and B6's own note names)
Caloric P6 (formalism)	D S · all others P or F	DEFENDE D as P	Deepseek's Fourier-machinery reading at full strength, alone of nine readers on the cell — the strongest machinery vote, printed
Newton P3 (constant)	C10, O P · eleven S	DEFENDE D as S	The G-anachronism fork, now two readers of thirteen; the ownership rule credits the frame that makes the constant invariant
Newton P6 (formalism)	P-face eight consecutive	DUAL confirmed	D and G the outliers (an S and an F); the dual's two faces unchanged
QM P4 (derivation)	O P · twelve S	DEFENDE D as S	The rare-elasticity cell's second dissenting vote ever, after the third blind reading
Darwin P8 (slope)	B6 SD · three aliens S	DEFENDE D as S	The scope-faithful dissent printed with its own note: 'include it and the answer is S' — the miasma lesson inverted
Darwin P4 (derivation)	G F · three S	DEFENDE D as S	The two-tests-bundle dissent its own note names; the Beagle data were old data, ruled three readings ago
Fixity P7 / P9 / P4	forks at 2-3, 3-2, 1-3	DEFENDE D as P, P, F	The Linnaeus concession stands on the graduated scale; the archive-versus-doctrine fork re-printed; the Cuvier-in-hours reading is a method showpiece, not a frame-vindicating note
Thermo P3 / P4	G S on P3 · fork 3-6 on P4	DEFENDE D as P, dual	The J/k middle band holds — the installed-at-consolidation reading is the dual's other face; the two-roads fork stable
Miasma P9 / P2; caloric P2; phl P2; ether P9	lone dissents (O P, G F, B6 F F P P)	ALL DEFE NDED	Every one printed: the lone-dissent pattern of the fourth round, the census unmoved where no second reading joins

Table 9 — The adjudication ledger: two new duals minted by the readers' own convergence, one new-pair cell moved, one new-pair dual split, and every defended cell printed with its dissent.

6. The Verdict: The Census After Thirteen Readings

The census after thirteen readings stands at fourteen theories, seven dead and seven living, the earth sciences entered, and no killing clause fired under any reading anywhere in the record. The dead side now spans five disciplines — chemistry, physics, astronomy, medicine, biology, and now geology — and the newest corpse is the instructive one: the settlement with the census's strongest instruments (it mapped the ocean floor, zoned the trenches, and built the reversal clock that killed it) fails every discriminator the living side satisfies, exactly as the miasma with its sewers and the fixity with its museums did before it. Generative harvest is not profundity; apparatus is not signature. The seventh pair's own asymmetry completes the set the sixth pair began: the fixity of species left its archive (the data), the caloric left its machinery (the equations), and the fixity of the crust left one theorem-like piece (isostasy) and everything its surveys minted — and only a deep revolution could inherit any of it. Tables 10 and 11 state the amended matrices.

Signature point	Phlo-giston	Ether	Epi-cycles	Mi-asma	Ca- loric	Fixity (species)	Crust
P1 Deletion at birth	F	P	F	F	F	F	F
P2 Unification	S	S	P	P	P	P	F
P3 Universal constant	F	F	F	F	F	F	F
P4 Derivation-first	F	P	P	F	P	F	F
P5 Conservative embedding	F	P	P	F	P	F	P
P6 Formalism / meaning	F	S/P	S/P	F	P	F	F
P7 Founders' coin	F	P	P	F	F	P	F
P8 Generative slope	SD	SD	SD	SD	SD	SD	SD
P9 Crisis-chaining	P	S	P	F	P	P	P

Table 10 — The census matrix after thirteen readings: seven dead theories. The crust column is new; the ether's and the epicycle tradition's formalism cells are the two new duals; the crust's embedding cell is the third (P/F). No dead theory carries an S on any of the five discriminators.

The domain-marked constant has now failed in four disciplines outside physics — biology twice, medicine once, earth science once — and passed for every physics resident; the demotion printed in the third round is now the most replicated finding in the census after the killing clauses themselves. The middle band replicates at its farthest point from physics: plate tectonics matches the biology residents cell for cell on derivation and embedding, fails the constant exactly where they do, and lands one face higher

on the formalism row — the data-rereading face, the Vine-Matthews tape recorder, the census's first non-physics resident whose founding act is a re-reading of held maps. The founders' row now shows its full range across the living side: the attested full coin (Darwin, alone in the middle band), the dual (germ theory), the compromise (plate tectonics, Wilson's reversal against his own record) — and the physics trio's full coins. The instrument's payment requirement discriminates within the middle band as finely as the constant discriminates across it.

Signature point	Darwin	Germ	Newton	QM	Relativity	Thermodynamics	Plate
P1 Deletion at birth	S	S	S	S	S	S	S
P2 Unification	S	S	S	S	S	S	S

P4 Derivation-first	S	P	S	S	S	S/P	P
P5 Conservative embedding	P	P	S	S	S	S	P
P6 Formalism / meaning	F	F	S/P	S	S	S	P
P7 Founders' coin	S	F/P	S	S	S	P	P
P8 Generative slope	S	S	S	S	S	S	S
P9 Crisis-chaining	S	S	S	S	S	S	S

Table 11 — The living residents after thirteen readings: seven ratified world-executed theories. The plate column is new — the middle band's fourth domain, the founders' compromise denomination, and the formalism row's first data-rereading resident.

And the fourth delivery's own verdict, which is the series' most instructive since the first alien: the families do not agree with each other. Six external lineages now stand on record, and their mutual agreements spread from the high nineties (the first two, one lineage in two runs) through the high eighties (each against the third family and the fourth delivery's three) — with nine distant disagreements among the fourth delivery's three, every single one on a cell the census had already marked as a fork. The instrument's honest error bars are now printed twice over: once as amendments (the census's own self-diagnoses), and once as the map of exactly where external families part (the amendments' own confirmation). Meanwhile the verdicts are over-determined: no reading from any lineage, on any panel, at any size, has ever moved a dead theory onto a discriminator, and the deepest challenge yet — gemini's ether, three S's in one reading — was tried cell by cell and declined on rulings printed before it was delivered. The kit re-issues at fourteen theories; the standing offer stands; the next pair, when the rule names it, will find the court already bound.

T14 exposed a second softness: is re-meaning data (Mason-Raff's 1961 stripes to Vine-Matthews's 1963 tape-recorder) the same trait as re-meaning formalism (Lorentz to Einstein)? I hedged with P.

— The sixth blind reading, point notes: the formalism row's data-rereading face, found blind — and adopted as the plate column's recorded cell

91.2 percent — the sixth blind reading vs the census the highest reading agreement in series history, zero distant cells: the amendments converge the instrument	9 / 9 pre-registration = blind reading plate tectonics confirmed cell for cell — the series' first living-side exact, the middle band's fourth domain	7 + 7 dead and living theories the census at fourteen theories, the earth sciences entered, no killing clause fired under thirteen readings
---	--	--

This amendment's own numbers: the record census agreement from the sixth blind reading, the series' first living-side exact pre-registration, and the census's final shape — seven matched pairs, fourteen theories, thirteen readings, nine duals, six external families, and every killing clause unfired under every one of them.
